Printed on: September 14, 2021
Format: 60x84/16 **Extent:** 21 printer's sheets
ISBN 978-5-00172-246-5

Translation in English:
Advanced AI models have translated the book from Russian into English. However, final copy-editing of the English text by a native speaker is still advisable and welcome.

Main purpose of the book

The main purpose of this book is to introduce a broad readership to a non-stereotypical, yet most integral and adequate worldview for today.
A new worldview is knocking at our door. The young and inquisitive minds succeeding the current generation are asking many questions that orthodox forms of public consciousness can no longer answer fully or satisfactorily.
Under previous (existing) approaches, the surrounding world (developing reality) was never truly examined deeply and consistently as a process and result of dialectical interaction between two non-identical (unequal, non-equivalent), but interdependent *fundamental principles*: its contentful and formal constituents-components. Thanks to an innovative research approach, it becomes possible to discern and understand the direction of movement or variability of everything that exists. Understanding the "mechanism" and orientation of universal motion, in turn, allows one to predict more accurately and confidently the development perspective both of the entire surrounding world and its individual elements.

Composition of the book

This book named **"Concept of Development: Non Trivial Outlook on Evolution"** includes four thematically interrelated articles.

The first article called **"Concept of Development: The Foundational Principle"** outlines the general provisions of the concept of development of the surrounding world, the core of which is the universal principle of self-development. The described in the article content-form transformations, which underlie all real processes, not only explain the spiral-cyclic nature of the world, but also make it possible to predict the prospect of its development. Namely this way of interaction between the fundamental origins of reality ensures the irreversibility of the evolution of forms, as well as the novelty, uniqueness and inexhaustible diversity of the latter.

The second article of this collection entitled "**The Nature and Meaning of Fundamental Constants**", which is an example of the practical application of the presented concept as an effective tool for investigation of the surrounding world, removes the veil of mystery from the very popular and wonderful numbers "**π**", "**e**" and "**φ**", to unrevealing the secrets of which the numerous scientific and literary publications are devoted.

The third article **"The Universal Criterion of Truth"** is a presentation of a nonstandard approach to determination of the meaning and role of the

pithiness of various forms of reality. As it's known, the cornerstone of the epistemology of any philosophical system or doctrine is **the question of truth**. The article shows that the criterion of the truth or verity of the forms of developing reality is not a practice, as it is erroneously considered to this day, but **the contentfulness** (pithiness) of these forms, whereas practice is only a method or procedure for evaluation of **completeness** of the contentfulness of the forms of reality.

The final article of the collection entitled **"Unlearned Lessons of Dialectics: From Whom and How to Learn to Think Dialectically"** is proposed as a link or "crossing bridge" from the experience, gained by Vladimir I. Lenin in the course of his use of the dialectical method while investigating the development of nature and society, to the presented here generalized concept of the development of reality. The submitted material can serve as a basis for the development and application of a unified methodology for conducting effective scientific researches of reality in any areas and at any level of its existence.

All four works are recommended to the attention of researchers as a source of alternative views on the nature and essence of the surrounding world.
The concept of the development of reality represented here is by far the most currently complete and adequate worldview concept in contrast to the known **fragmentary** theories and world pictures.

ARTICLE 1

Concept of Development: The Foundational Principle

Abstract

This article is devoted to the exposition of a worldview concept based on the awareness of the significance and role of the relations of the widely known foundational aspects of reality: content and form.

Content and form are two inalienable constituent sides of any element of reality, be it an object, a process, or a phenomenon. By virtue of the omnipresence of content and form, the relations of these components — these two principles of reality — prove to be the most important and essential.

In the course of analyzing the aforementioned relations, the internal source of evolutionary movement and the "mechanism" of its functioning are revealed, on the basis of which the directionality of evolutionary processes is defined and formulated for the first time (i.e., an idea of the vector of change, movement, and development of the surrounding world and its elements is given).

The content-form transformations of unitary directionality described in the article, which underlie all real processes, not only explain the spiral-cyclical nature of the world but also make it possible to forecast the prospect of its development. It is precisely this mode of interaction of the fundamental aspects (principles) of reality that ensures the irreversibility of the evolution of forms, as well as the novelty, uniqueness, and inexhaustible diversity of the latter.

The approach under consideration fundamentally levels any "centrism" ("absolutism") of whatever form, pointing both to the limited applicability of the currently dominant anthropocentric (as well as bio-, theo-, and sociocentric) model of the world, and to the necessity of transition to another, more integral and adequate model of it.

This concept may be recommended to the attention of researchers primarily in view of its integrity (in contrast to the fragmentary pictures of the world and theories of the past and present), as well as by virtue of the following considerations: whoever possesses the most adequate worldview — the future belongs to them.

Introduction

A reader inclined toward the philosophical comprehension of natural-scientific and humanitarian knowledge has surely had occasion to reflect on the fact that at the basis of real processes lie, and govern the surrounding world, deep-lying regularities different from those that are discovered on the surface and perceived as self-evident. We are speaking of objective fundamental relations that condition, among other things, the functioning and structure of the economy, politics, science, culture, and other aspects of the life of human communities.

On the basis of many years of tracking discoveries and achievements in various fields of the natural and humanitarian sciences, I will venture to state that to this day what takes place everywhere is chiefly the mere accumulation and mechanical "warehousing" of factual material, and there is as yet not a single contentful unifying idea that would allow us finally to realize what the observed and "warehoused" phenomena actually represent. In other words, the need for an integral and *adequate model* of everything that exists, develops, and evolves is felt ever more acutely.
I believe hardly anyone would object to the proposition that knowledge and understanding of the aforementioned regularities would contribute to raising the accuracy of analysis and forecasting (based on this analysis) of the course of real events.

The article presents a non-standard view of the principles of organization of living and non-living nature, of the origins and directionality of evolution; after acquainting himself with it, a reader interested in such questions may

develop a motivation for a critical rethinking of established worldview attitudes and a revision of the methods of analyzing the factual material and information obtained, which will ultimately be expressed in an increase in the effectiveness of the cognitive process.

This is, perhaps, the most integral and adequate concept available today, encompassing the spheres of interest of numerous scientific collectives and making it possible to comprehend the principles of *correct* forecasting of the development of reality.
Below it will be shown **WHAT** in fact lies at the basis of the development of reality, which is accomplished in many respects through inversion (i.e., the "turning over" of roles, methods, and notions, in Marx's figurative expressions, or "return into the foundation," in Hegel's terminology [12, p. 102]).

Thus, the reader's attention is offered a "thesis" version of the concept [1; 20], which examines the system of natural-scientific views and representations concerning the evolutionary movement and development of reality from the standpoint of implicit but objective deep-lying regularities that underlie these views and representations.

The essence of the proposed concept of development and its foundational principle

Traditionally, one speaks of the movement and development of anything, first of all, as of *change*: nothing remains for any length of time equal and identical to itself. At the same time, it is impossible to speak of changes apart from connection *with what already exists*. Stars, planets, oceans, and mountains change; plants, animals, people, and the products of human activity change even faster and more strikingly. In other words, changes are never isolated and abstract, but are always attached to *what exists* — to objects, processes, phenomena, i.e., to some already existing *basis*. At that, it is not possible to separate *the changing* from *the existing*, i.e., change from basis, which compels us to speak of the movement and development of any object, process, or phenomenon as of a derivative of a certain symbiosis — of *basis* and *change*.

In general form, it is convenient to speak of such a symbiosis in terms of the *bilateral*, *two-component* **relation {content/form}**, i.e., in the notions of the categorical apparatus developed sufficiently deeply before us by our outstanding predecessors-dialecticians. Of the movement and development of any object, process, or phenomenon one can speak as of a *contentful* change of its *form*. The contentful changes that take place in reality manifest themselves through changing forms. Indeed, if one scrupulously analyzes the changes and transformations occurring in our surroundings (equally as in ourselves), one can see that behind all changes and transformations there is implicitly discovered a single-in-essence process of the movement of a

certain contentful activity through a series, a chain, a sequence of changing forms.

In order to avoid misunderstanding and divergent readings, let us cite the textbook interpretation of the notions "content" and "form" [13, pp. 621, 622]. Content is the determining side of the whole, the aggregate and unity of all its constituent parts, properties, internal processes, contradictions, and tendencies; form is the mode of existence and expression of content. In the interrelation of content and form, content represents the dynamic side of the whole, while form encompasses the system of its stable connections.
The relation of content and form is characterized by a unity reaching the point of their transition into each other; however, this unity is relative. Content is not the substrate by itself, but its internal state, the aggregate of processes, and in this sense content itself acts as *a process*. The understanding of form, in turn, presupposes the consideration of it as a developing and becoming *structure*.

Content, being the active *side*, represents the mobile (as a rule, internal) *constituent* of the relation {content/form} and symbolizes change (at times quite hidden, veiled). Form, at that, as the passive external *constituent-side* of the same relation, follows the active internal content.

As the active constituent side of the relation, content is internally inherent in a certain impulse, stimulus, urge, motivation toward change, movement, development. This is, first of all, what distinguishes the active contentful side from the formal passive one. Then change, movement, and development themselves do not arise suddenly and do not appear as some separate, isolated, and independent element, but prove to be a derivative or consequence of the interaction of unequal, dissimilar constituent sides in their relation and striving to equalize, to identify with, and to become each other.

Meanwhile, at every attempt to single out either of these two constituent sides in "pure" form, without the "admixture" of its other, we get into a fix — both sides, upon closer examination, sink their roots one into the other, bear simultaneously the features of their other, which testifies, apparently, to their deep ***syncretism***.

Extremely important in this connection is Hegel's point of view on the interrelation of content and form, who believed that "content is not formless, while form is at one and the same time both contained in content itself and represents something external to it," which reduces to the absolute relation "between form and content, namely — their transition into each other, so that content is nothing other than the transition of form into content, and form — the transition of content into form" [2, p. 298].

In this way the constituents in the relation {content/form} interact with each other, or more precisely, as it were, "live" **by the striving to become each**

other and to absorb each other completely and without residue, by the striving to turn into identity with each other, *by the striving toward mutual transition, mutual interpenetration, mutual transformation, mutual expression*...

Since it is simply impossible either to single out or to separate content from form (with respect to concrete objects, processes, phenomena), *the most productive, rational, and correct way* is to speak only of **the relation** of these two mutually interpenetrating constituents-components-sides of concrete objects, processes, and phenomena.

In this light, every concrete object, process, or phenomenon is the relation of its sides or constituents {content/form}, and, in the final analysis, what matters here is not each constituent side by itself, but precisely their ***relation***; the development of any object, process, or phenomenon, in turn, is the expression or representation of changing content by means of changing forms and, ultimately, it is the process of becoming and manifestation of each such concrete form in the form of a definite **correlation** (***relative balance***) of the aforementioned constituent sides (with the possibility of expressing and representing the said correlation, including in mathematical or digital form).

Against the background and in the terms of these representations, the following simple idea acquires a more or less coherent shape: everything that we see, hear, and feel, everything with which and about which we think, i.e., everything that surrounds us, including ourselves, — these are various formations or **forms** of different levels (different degrees) of contentfulness, into which ***a certain contentful activity*** is clothed in its movement from level to level.

Such formations-forms represent dipoles (spirals) of two poles (two branches), one of which is the *contentful active* constituent side of the dipole (spiral), the second — its (its) *passive formal* constituent side; in the philosophical aspect, the aforementioned dipole (spiral) is similar to the relation of two abstract notions {content/form}. An approximate visual model of such a dipole-spiral is given in Fig. 1.

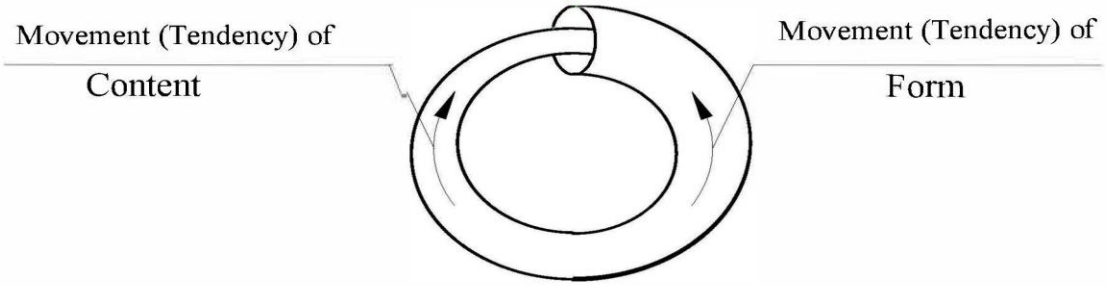

Fig.1

[Fig. 1 — schematic representation of a dipole-spiral: the contentful side (movement of content) and the formal side (movement of form) as two branches of one spiral]

Continuing to proceed from real relations and basing ourselves on them, we follow further in our reasoning. Interacting with each other, dipole-forms of different levels generate dipole-forms of new levels. The contentful constituent, being the active side, strives to escape the control of any and every form that encompasses and contains it; however, not having the possibility to realize itself otherwise than again through some form, it is forced each time to clothe itself in the next, unrelentingly following changing form. *In prospect and in the ultimate expression*, this process takes the form of an endless "chase" of the contentful constituent (content) after the very same contentful constituent moving and developing in such an uncomplicated manner. [One can arrive at such a conclusion by using, for example, the device of the limiting transition, which mathematicians apply when finding the limits of functions.]

Modifying and adapting the initial model (Fig. 1) in line with what has just been said, we arrive at the following *conceptual* form of it, which brings us close to understanding **the directionality** of the course and development of all real processes, i.e., **the vector** of development of anything whatsoever. In a more or less laconic form, the formulation of the directionality of the development of reality looks as follows: **the development of content is accomplished in the direction of the exhaustive expression** (encompassment, absorption, assimilation, appropriation, comprehension...) **by the developing content of the very content developing in such a way**.

Let us denote the formulation by the symbol **@** for the convenience of further handling of it.

With respect to the surrounding world, this formulation means approximately the following: *everything that exists and develops has as the direction of its development and existence the expression (encompassment, absorption, assimilation, appropriation, comprehension...) by itself, the existing and developing, of itself, the existing and developing*.

Taking into account the previously noted inseparability of the components of content and form in their actual relation {content/form}, it becomes obvious that the external manifestation of the above-described process of contentful accumulation @ proves to be the renewal of the form of expression of the accumulating content by raising the "storey-ness" or level of this very form of its (of the accumulated content) representation. As indeed happens in reality, the movement of content determined by formulation @ cannot be realized otherwise than through forms of different levels of representation of this content that do not repeat in details.

Thus, we are speaking of the description of *an infinite, unceasing process of contentful movement, realized by means of successive approximations to the exhaustive expression of the very contentful movement*; in this way, in conceptual-abstract language, a *multilevel* formation (form) is described, whose constituent parts (branches), like the formation as a whole, are similar to "self-winding" spirals.

Within the conceptual (notional) formulation @, which models the development of multilevel reality, in a "sublated" (as philosophers say) form are "packed" both the activity (movement-development), and the directionality of this activity (movement-development), and the contradiction (as the source of all movement-development), and the laws of dialectics, etc., etc.

In essence, a general, single, universal *internal* **principle of self-development** (*self-organization*) of reality has been formulated, an implicit or explicit hint (and in other cases — a firm conviction) of the existence of which is present in the representations and statements of a huge number of scientists, researchers, and philosophers of the past and present who have devoted themselves to the study and interpretation of the surrounding world and its evolutionary movement [3-7; 9-11; 14; 16; 17].

That is why all real processes have a spiral-cyclical character !!!
In other words, by virtue of relations of this kind, our world and all its elements are spiral-shaped: man is a spiral, a dog is a spiral, an ant is a spiral, a living cell is a spiral, a molecule is a spiral, an atom is a spiral, an electron is a spiral, a photon is a spiral, a galaxy is a spiral, the Universe is a spiral; anyone who wishes may exercise in continuing this list as far as they like. The brain of two hemispheres, the heart, the lungs, and other internal organs and systems of man (as, incidentally, of other individuals of the animal world) likewise represent **bipolar spiral structures** (see Fig. 1).

On the other hand, it is precisely this mode of interaction of the foundational components of the said relation {content/form} that *ensures the novelty, uniqueness, and irreversibility of the development and evolution of forms, as well as the inexhaustible diversity of the latter*.

As already noted above, in this way the components-constituents in the relation {content/form} interact with each other, submitting to the "dictate" of the objective tendency with directionality toward becoming each other and absorbing each other completely and without residue.

However, if one gives preference only to this point of view on development as the movement of the foundational principles-components of reality only in the direction of convergence and reunification (i.e., thereby dooming everything visibly existing to a supposedly obvious end and degeneration into identity), — then how can one explain the presence and the tireless, unceasing replenishment and renewal of opposites ("dissimilarities") and

their inexhaustible interaction and opposition in the surrounding world? In what way does the inexhaustible difference then arise and manifest itself under the conditions of the total striving of everything toward unification and coincidence proclaimed here?

However paradoxical this may seem, it is precisely by virtue of such a naturally conditioned character of movement (striving) that renewed extremes, opposites, and their opposition can only arise and manifest themselves. The interaction of two initial extremes, of two non-coinciding principles, of two "sworn" competitors, of two unequal and non-equivalent forms generates something third, a certain new form, which, along with the content and attributes "absorbed" into itself of the interacting initial forms, simultaneously bears in itself also the difference from each of them. [For this reason, in particular, the "holistic" assertion that the whole is always greater than the sum of its parts is not without foundation.]

It is precisely the striving of two unequal, non-identical competing constituents of one relation to become each other in the course of their interaction (see Fig. 1) that leads to the emergence of something third, coinciding neither with the first nor with the second. In other words, the movement of content through the encompassment and absorption into itself of the content of previous forms constantly generates dissimilarity to everything preceding, i.e., **novelty and uniqueness**. But this very difference arising "in continuation," simultaneously or "in parallel," acquires, in essence, also the form of a new, next opposite, which immediately begins to oppose everything existing (and preceding) and, again, to enter into interaction with it.

Thus, under the declared striving toward unity and coincidence, difference and dissimilarity (novelty) arise each time as if automatically and derivatively with respect to the more primordial, more initial, more fundamental and priority movement toward identity. On the other hand, this derivatively obtained non-coincidence, in turn, proves to be the cause and ground for the excitation of the next "act" of movement (striving) in the same direction toward unification, which again, in its turn, generates a new portion of difference and novelty, serving as the condition for the continuation of the "conflict," competition, interaction, etc., etc. — to infinity in its process of quantitative and qualitative renewal. The very divergence into extremes and opposites is a consequence of *the preceding* and simultaneously a cause and condition for initiating *the subsequent* movement in the same initially determined direction — toward the mutual transition and coincidence of extremes, toward their "drawing together into a point." [Let us note that the latter is not asserted (and not imposed) as a final result and achieved goal, but is considered only as an understood and comprehended objective tendency that subordinates to itself the course of all processes without exception — as an asymptotic relative movement toward a certain absolute, but never attained limit.]

It is superfluous to mention that representations of spiral development are ***as old as the world*** and there is no novelty in these representations. What is new and curious — is in the description of the "mechanism" that produces spiral-cyclical movement, i.e., in the description of **the functioning of the internal source** of such movement.

Heraclitus's saying is widely known that everything flows, everything changes. But **WHERE** all this flows and changes — until now there have been no clear representations. Only today does the possibility open up to answer this question more or less intelligibly. Today we can meaningfully determine ourselves with respect to the *vector* of this universal movement: everywhere and always there takes place a total *multilevel* movement in the direction of achieving ***the highest level of contentfulness*** (see formulation @).
Everything without exception is permeated by the striving and embraced by the movement in the direction of possessing the highest contentfulness. By this vector of universal movement are determined the causality, meanings, and goals: of life, development, evolution, history, etc. — i.e., of the being and existence of anything whatsoever, in whatever forms.

The formulation of *the principle of self-development* @ gives an idea of the "unidirectionality" and "multilevelness" of development, i.e., firstly, of *the uniqueness* of each of the arising and developing forms-levels (which fundamentally levels *the centrism* of any form whatsoever, including biocentrism, anthropocentrism, theocentrism, sociocentrism, etc.), and, secondly, of *the universality* of the mechanism of movement-development of all forms at their levels (which, at last, throws *the long-awaited bridge* between the levels of the non-living, the living, and thinking, extremely in demand and necessary for the formation of integral and adequate representations of the world).

By virtue of the inexhaustibility of the interconnection of the contentful and formal constituent sides in the relation {content/form} noted above, whatever relative independence *the contentful constituent* may possess, nevertheless it too cannot manifest (and keep manifesting) itself otherwise than through form. Therefore, despite the leadership and seeming autonomy of the active contentful side at all levels of development, as the contentful constituent at any of the levels can act, again, only **forms** (such is the essence of the "eternal curse" imposed on content — to be burdened with form, if one paraphrases Marx's well-known expression about the relation of spirit and matter [8, p. 29]). Thus, in both cases (both in the case of the active "contentful" constituent and in the case of the passive "formal" side) in reality one has to deal with *changing* and *developing forms*, by which one should understand all sorts of structures and formations of different (objective and subjective) levels of reality of varying degrees of contentfulness (both in macro- and microscopic executions).

Realizing the total unitary directionality of all real processes, exhibited by formulation @, it is nevertheless necessary to take into account that at each

of its levels of movement *the dominant active contentful constituent* (contentfulness) has its own *special* (specific) *forms* of representation.

A). At the level of non-living nature — this is, as a rule, the energy of the Sun and of space (light, heat, radiation, gravitation, high-energy particles), electrical energy, the chemical energy of oxidation-reduction reactions, etc.

B). At the level of living inanimate nature, in addition to what is named above in point A — these are nutrients (from the composition of soil, water, air, combustion products), food (plant and animal), the flow of blood (in living organisms), the genetic program, reflex-psychic activity, instincts, etc.

C). At the level of human and social nature, in addition to what is named above at the two previous levels A and B — these are mineral resources, fuel (coal, oil, gas and their industrial derivatives), the human resource (muscular force, spiritual and moral forces, creative and intellectual potential), products of human activity and thinking (image, idea, notions, tool, money, capital, financial and information flows), etc. In other words, at the level of man and society the same active contentful constituent circulates in the form of the forms enumerated in the two previous points A and B, with the addition of human-mediated forms (including the forms of all sorts of products of human activity and thinking — *technologies* and *ideologies*).

[*Additional commentary to the three last paragraphs above*. From the standpoint of this concept we proceed from the fact that various kinds of energy, food (nutrients), money (financial flows), information (the information field), etc. — these are merely **various forms of movement of the active contentful constituent of the relation {content/form} at different levels of reality**. Thus, *at the level of non-living nature* the active contentful constituent circulates in the form (in the forms) of, chiefly, solar and cosmic energy. A derivative and variety of such circulation flows is electrical and chemical (of oxidation-reduction reactions, etc.) energy. *At the level of living inanimate nature*, to the above-enumerated circulation flows (continuing their natural transformations also at this level) is added the circulation of the following basic contentful forms: nutrients from the composition of soil, water, air, and combustion products; nutrients from the composition of the soil, plant and animal food; the flow of blood of animals; the genetic matrix, instinctive and reflex activity of the living, etc. And, finally, *at the level of man, human thinking, and society* — this is, *in addition* to the above-enumerated flows at the two preceding levels, the circulation of the contentful component in such forms as human-mediated energy of mineral resources and their industrial derivatives (metals, minerals, fuel, etc.), the human resource (in the form of muscular energy, spiritual and moral forces, intellectual potential), products of human activity and thinking (tool, money, capital, financial and information flows, ideas, notions, theories, teachings, i.e., in the most general form — *technologies* and *ideologies*), etc. Here it is necessary to note that everything enumerated above from the most widespread forms of movement and circulation of the

active contentful constituent at the aforementioned levels — these are only "reference points" in the general aggregate of such forms; guided by this approach, every inquisitive mind will be able to discover also many other active forms of different levels of contentfulness, also submitting in their movement to the single principle @.]

As can be seen on the basis of the analysis of the formulation of the principle of self-development @, the question of the essence of development is not exhausted by the understanding of development as the complication of forms, or as the action of the great biological law of complication, or as the causal continuous complication of matter, etc. [4; 9; 11] (these explanations and definitions of the essence of development dominating in the scholarly milieu are capable today of satisfying at most a housewife); the essence of any development consists in the achievement by forms of different levels of development of ***the highest contentfulness*** for each level, which is expressed (and ensured) by the movement of forms in the direction of possessing the maximally possible contentfulness at their levels.

The formulated *principle of self-development @ is universal*; all processes without exception at all levels of reality known to us are subordinated to it and governed by it: at the level of non-living nature, at the level of living inanimate nature, and, finally, at the level of man, human thinking, and society, which can be confirmed and interpreted by diverse factual material, including simple examples from everyday life [1; 20].

Below, on numerous examples, we will show — how this *internal principle of self-development* "works" in different areas and at different levels of the acquisition of changing reality.

Why, then, are the concepts of such an obvious spiral movement-development-evolution of forms considered obsolete today, are examined and discussed reluctantly, and are sometimes subjected to harsh criticism on the part of the official scholarly community? Specialists on questions of evolution substantiate their disagreement with concepts of this kind by the fact that in none of the developing forms (objects, processes, phenomena) does the course of their development resemble (and reduce to) *in pure form* an ascending classical spiral, and in the majority of analyzed cases this spiral is distorted and interrupted by segments of some straight lines unlike spiral ones (indicating the movement-development of forms by a certain "inertia"), horizontal plateaus (symbolizing the stagnation of forms) and, finally, descending segments (meaning regression, depression, decline, etc.). Indeed, in the study of the evolution of real forms, obvious deviations from the spiral character of their development are observed and recorded at every turn, and therefore, probably, the *collective* spiral as an indicative external form of expression of any development recedes into the background.

At that, however, the scholarly community loses sight of the following circumstance. As already noted above, the spiral contentful movement has as its reverse visible side the formation of new and the filling with content of renewing forms. In other words, the reverse side of the implicit, hidden movement of content in the direction @ proves to be the inevitable emergence and manifestation of modified and new forms of different levels filled with content, visible and registered by human consciousness, which, as they arise and are modified, enter into interaction with each other, continuing their movement-development in accordance with formulation @. And this objectively conditioned movement toward the increment of contentfulness of any and every interacting form, which, as already noted above, is characteristic of all levels-forms without exception, is accompanied **by the total competition of forms** (as if we were speaking of participants in a race to a single finish).
Not having other sources for replenishing and building up their content except other similar forms, all forms, in the name of ensuring their own movement and development under the "dictate" of principle @, *are forced* to enter into a harsh competitive struggle "for survival" with the forms surrounding them, the outcome of which proves to be either continuing development, or the perishing and "tearing apart" into parts (absorption and assimilation by competitors) of this or that form. *Regression, by and large and on a universal scale, does not happen!*

By virtue of the mutual total, universal, and wholesale competition of forms striving toward one "goal," which is determined again by the principle of self-development @, forms "withdraw" from each other and "appropriate" for themselves everything that lends itself to withdrawal and appropriation. The "uncontrolled" taking away and annexation of portions of content takes place at different levels and in different chains of development. At that, the objects of multilevel taking-away-appropriation prove to be quanta of energy, electrons, ions, genes, chromosomes, cells, portions of substance, objects, ideas, bits of information, name, glory, reputation, ideologies, technologies, and entire fortunes (everything, as in real life!). As the experience of numerous and many-year observations shows, when one form "weakens" and "dies" — somewhere nearby (inside or outside) another begins to "assert itself" and "flourish." Stagnation or regression of any form means an increment of content in some of its neighbors (and perhaps not exactly neighbors). As soon as at any form at any of its sublevels the initiative is substantially "intercepted," the "tearing apart" of the content of this form at all its other sublevels and sub-sublevels immediately begins — up to the complete liquidation of this form and the assimilation of its content by other forms. That is why one level-form can quite unexpectedly fade or disappear, and another begin to develop and modify spontaneously.

Thus, universal and wholesale stagnation or regression does not happen, but always and everywhere there take place only content-form transformations (or, speaking in the habitual "school" language, — the transition of the contentful constituent from one form into another, i.e., from level to level),

during which the decline or loss of content by one form are signs of the interception of this content and its annexation to itself by another form. Which of the forms, of what level, at what segment or stage of its development will hold out in the unceasing competitive struggle and continue (possibly even more intensively, with a "leap") its further development, and which will disappear forever — it is extremely difficult to predict; for, **by virtue of universal competition and total rivalry**, the process of the evolution of forms does not have the appearance of a straight high road and does not fall under the definition of a strictly "tree-like" process (as is noted by modern leading evolutionists [18]), but is realized by the method of "punctuated gradualism" with the recreation and reproduction of a "mosaic" picture of development. That is why (namely — owing to such "pressure across the whole field") any and every of the existing and developing forms (including humanity when colliding with the so-called challenges and threats from the side of both other forms of the surrounding world and man himself) has to prove every moment its competitiveness, viability, and right to further existence and development.

In the end, against the background of the general single regularity that lies at the basis of the change-movement-development-evolution of all forms without exception and is called *the principle of self-development* @, the interference and mutual intervention of forms (in line with the same regular striving of theirs toward the appropriation and annexation to themselves of portions of content by taking these portions away from other forms) lead to the chaoticness and spontaneity of the movement of individual forms, which leads to the visible distortion of the general picture of development by inclusions of deviations from the general regularities. The implicitly expressed cause of the departure from the regularities of development (determined by principle @), which (cause) is the interference-intervention of forms in each other's spiral development, has received (both in science and in everyday usage) the name *of the all-reconciling, all-explaining, and all-forgiving* ***chance***.

May the reader forgive some figurative expressions and free analogies used in the article to simplify the real picture with the aim of facilitating the examination of the essence of the relations under consideration, — the French, for example, when encountering deviations of this kind in the behavior of men, habitually say: "Cherchez la femme" ("Look for the woman"). With respect to this context, i.e., in a broader sense, this means: look for the form (or forms) from the near and far surroundings that draws onto itself, "snatches away," and annexes to itself portions of "alien" content, thereby distorting the universally spiral configuration (with respect to individual fragments of the general picture) of regular development. It is precisely the total competition of forms unitarily oriented in their movement that violates the decorous regularity and predictability of the trajectory of their development. Not seeing all this background, human consciousness in the person of the scholarly community for that very reason does not wish to

recognize the spiral character of development as the only essential and really realized mode of evolutionary movement.

We will not fail to add that the above-stated fully applies also to man as a multilevel natural formation, as an aggregate of a huge number of *concrete* **relations** (of different levels and different contentful filling) of the same omnipresent *abstract* components {content/form}. The failures, illnesses, miscalculations, and errors accompanying man throughout life are the result of the taking-away-appropriation of portions of his own multilevel content (from the category of energy resources of flesh and spirit, food, blood, money, capitals, ideas, knowledge, technologies, information, etc.), carried out (we are speaking of the taking-away-appropriation) by multilevel forms (both "internal" and "external") from among the forms of his near and far surroundings. The complexity of the analysis of the development of such systems is conditioned by the unimaginable interweaving of the simultaneously interacting aforementioned levels-relations, as well as by the inseparability of the components of these relations; the said elements are so interwoven with each other and coiled into such an "ugly" tangle that for the correct untangling of the tangle universal patience and exemplary accuracy are required.

[The mentioned complexity is a consequence, firstly, of the natural, objective blurriness and fuzziness of the boundary between the constituents-components examined by us in their concrete relations and the most general relation {content/form} and, secondly, a consequence of the infinity of the representation of any and every form, including the "numerators" and "denominators" of the relations under consideration, the same thing in the form of similar relations, and, correspondingly, of the unthinkable interweaving of all these relations and their components with each other. The levels of development are often inseparable, not detachable from each other because the contentful constituent, say, of one level can at one and the same time (in interconnection) prove to be the formal constituent for another level, and vice versa. And also because the contentful constituent of one level necessarily represents a new relation {content/form} for another level. The same should be said about any formal constituent. But the main obstacle on the path of clear understanding of the course of the process of development and of its precise formulations consists in the fact that the natural boundary between the components-constituents "content" and "form" in their relation is difficult to distinguish, and sometimes simply not perceivable (for the time being). Thus, the ingrowing of levels-forms into each other and their growing out of one another is precisely the cause of the impossibility of singling out any of them in "pure" form].

Analogous reasoning, but with the opposite sign, can be adduced with respect to the ascending segments of intensive development of any form (as of any organism, including man) — at such stages of its life path any form, being an active contentful link and *on the rise*, itself successfully performs

the taking-away and appropriation of contentful portions from the composition of the forms of its near and far surroundings.

It should be especially noted that *the principle of self-development* is unconditional and non-relative, and this circumstance is emphasized by the content of its formulation @. The "activity" described by the presented formulation is inherent in all levels of reality without exception and can be characterized as "blind," since in its initial foundational form it contains neither explicit features nor explicit shades of goal-setting. Shades of goal-setting and expediency of attitudes clearly manifest themselves only at quite definite levels *of quite concrete forms* of realization of this principle, beginning with the forms of higher animals, where **the intensity *of content-form transformations*** is substantially higher than the intensity of similar transformations at the preceding levels.

In other words, by virtue of the noted heightened intensity of content-form transformations at the levels of animal forms and man in comparison with the speed of similar transformations at other levels-forms, the omnipresence of the said principle is guessed and fixed by human consciousness from a certain time ever more and more definitely, which testifies to its (of the principle) **unconditionality** and **non-relativity** contrary to the erroneous opinion about the endowment with the capacity for goal-setting of only some "higher" levels. This, so-called, goal-setting (return to oneself at a new level, feedback, reflection) is simply still very weakly manifested at the "lower" levels of the development of reality *owing to the small intensity of content-form transformations at these levels* (i.e., *by virtue of the small curvature of the spiral coils of development of these levels*). **In actual fact, this internal principle is immanent to all levels of the development of reality without exception**.

Independently of us and our preferences, the source of the development of concrete forms-relations at all levels of the organization of reality known to us (quantum [15], atomic, molecular, cellular, tissue, organ, organismic, social) is served by the same principle @, which remains "through-going" for all levels of contentful movement; only *the forms* of realization of this principle *at different levels* change, *owing to the growth of the intensity of content-form transitions* from level to level.

Thus, the Universe (as an aggregate of non-living and living forms-formations, including thinking) from the standpoint and in the light of this concept — is a gigantic, majestic, *multilevel content-form transition* stretched over billions of years (more precisely, *a chain* or *sequence of transitional forms of different levels*) *in the already known direction* @ (i.e., in the ultimate expression the world, the Universe — this is precisely the "self-winding" content of "all-embracing" scale, see the simplified visual three-dimensional model of the unfolding process in Fig. 1, *approximately* reproducing the picture of real "universal" relations). The starry sky — this is an instantaneous "slice" of the forms-traces of the parallel-sequential

movement of "content," grasped and fixed by human consciousness at one moment. The host of worlds hanging above us — these are intermediate layers-stages-levels-forms of the passage of contentful activity, but not in the form corresponding to the initial moment of its sequential movement-passage through the mentioned stages-forms, but in the form of something already "become" and developed by virtue of the unceasing parallel-continued and continuing since that moment contentful "winding" of these forms. At that, the conditionally-final link of the development of contentful activity in the person of us (humanity) — is also merely an intermediate form of expression or representation of this activity, which, after the passed stages-levels of "non-living" forms, passed also through the stages of more mobile forms — "living-biological," and further — "living-thinking-animated."

Today's we (humanity) have reached in our mental development such a level when we can quite well imagine ourselves in the role of a sort of "contentful mollusk" located "in the shell" of an all-round "expanding form" (the Universe) and attempting, as the most contentful link (of those reliably known to us at the current moment), to comprehend, to cognize (i.e., to fill with content and true meaning) that chain of forms which we have "passed" before this since the time of the Big Bang. In turn, that "expanding form" once passed by us strives after us (and, in essence, toward us) for reunification with us and the possession of our contentful principle. In actual fact, we, as the next form of the contentful principle, attempting to close this coil, unwind it again, but already at a qualitatively different (new) level. At that, we equally have no grounds to assert both that the sequential contentful movement ends with us (humanity) and that we (humanity) are the crown of all development, and that an analogous kind of movement of contentful activity did not take place before the moment of the so-called Big Bang and does not take place after the appearance of us (humanity).

The awareness of this circumstance, as it were, formally closes the next "circle" of cognition and opens a new stage-coil of qualitatively different investigations of the Universe and the evolutionary movement.

Contentful stratifications contribute to the change of the intensity of the striving of content "to itself at a new level" or, in other words, to the change of the curvature of the coil of the spiral of development, — and it is chiefly by the values of these characteristics that one level of development differs from another. Whether we understand this or not as people, whether the dog and the ant "want" this or not as an animal and an insect, whether the river, the ocean, the mountain, the planet Earth, the Milky Way, or the Universe visible and thinkable by us "know" about this or not — independently of this, *everything enumerated is in the movement described by formulation* @.

By the way, when attempting to depict or reproduce in the minutest details the most intimate moment of the mutual transition of content into form and vice versa with the help of, for example, pencil and paper, — your hand will unfailingly draw something resembling an apple, a pear, a leaf of a plant, a

heart, or anything else in a similar vein (for schematic clarity one can recommend for viewing the video clip [19]). This circumstance allows one to discern in the actions of nature a process analogous in directionality, namely — with stubborn periodic constancy, mother living nature herself, year after year over hundreds of millions of years, solves the same task that you have intended to solve as well.
Apples, pears, acorns, grains, seeds, leaves, grass, flowers, bushes, trees, animals with their mirror symmetry-asymmetry of forms-bodies (see Fig. 1), as well as the naturally conditioned relation {man/woman} continuing this same list, etc., etc. — all these "living" attributes by their obvious external appearance and internal structure point to the uniform unitary directionality of natural processes, which have as their background the interaction of two constituent sides-components of a single whole — the relation {content/form}. And just as you, she (nature) in no way succeeds in mastering the moment of the content-form mutual transition finally and irrevocably, since the very *unattainability* and *unrealizability* of the moment of the exhaustive expression of content by form, ***the very*** **indeterminacy** of this moment (in view of the presence of the so-called step or gap in the place of the supposed closure of the "circle," but of the actual transformation of the "circle into a spiral," see Fig. 1) is precisely the main condition, the moving force, the motive, the stimulus, the cause of the non-stopness, inexhaustibility, and unfathomability of the movement and development of everything existing. *The moment of indeterminacy is also an objective and inalienable element of any development!*

In an analogous manner proceed the processes (movement, flowing-over, and mutual transition of notions and images) also at the level of *thinking*. At the seemingly attained moment of "victory" it is suddenly discovered that you have expressed and comprehended by your thinking not quite what you were exerting yourself to do a moment earlier, but stand at the source of something else, which is no longer the crown of the preceding, but is the beginning of a new something; i.e., you and your thinking are simply *thrown out* onto a new coil, onto a new level, toward a new understanding, toward refined-renewed notions and representations, and you *are forced* to continue the begun movement in the direction of comprehending and shaping the continually slipping-away content (in the guise of a promising thought or a coveted-sought meaning), but already on a new coil and at a new level... And there is no "return" road, since along the road "there" in the direct direction you and your thinking have managed to change, to grow over, to accrete, to enrich yourselves with new contentful details, to "shake off" which and return to the former state there is no possibility whatsoever.

Processes similar in character proceed also in the milieu at the level of society; moreover, on the example of the development of social relations this shows through especially prominently. The confrontation (competition, rivalry) of, say, ideological schemes (ideologies) or the geopolitical opposition of states and peoples, the movement from a unipolar to a multipolar world and vice versa, the emergence and resolution of revolutionary situations —

all this also belongs to the external manifestations *of the development of the relations* of the aforementioned contentful and formal constituent sides (see Fig. 1), but already at other levels and, correspondingly, in other specific forms.

The confrontation of ideas and ideologies — this is the highest (from the point of view of human consciousness) level-form of *contentful* movement of the levels-forms *known* to us today. The difference in ideologies, i.e., the visible distinction of competing and opposing forms in their relations at this or that level, is conditioned by the internal *functional* distinctions *of the active* (often *aggressive*) and *passive* (*conservative*) components of these relations. And for a whole series of individuals (and their communities), participation in confrontation at such a "high" level will be more attractive than interest in the results and consequences of movement and transformations at other, more "primitive" (say, physiological, including the striving toward satiety, physiological pleasures, bodily comfort) levels. And therefore the human striving toward ideological victory, intellectual or moral superiority, spiritual greatness in many cases takes the upper hand and proves to be more priority than the striving toward physical well-being. Everywhere and always, **at all levels without exception**, there takes place the wholesale, **total competition** (from soft "sporting" contest and rivalry to merciless struggle) **of forms for the possession of the highest level of contentfulness**; from the standpoint of human thinking, the level of the highest rank and fullness of embodiment of accumulated contentfulness today is precisely the ideological level.

Proceeding from these representations and the understanding of the essence of the problem, it proves simpler to build an adequate model of the opposition and interaction of geopolitical antipodes (two branches of the coil of the spiral of development, see Fig. 1) in their relation of confrontation (conflicts, wars) and simultaneous closest interconnection with each other; on this same basis it is easier to forecast and direct the efforts of competing human communities toward the achievement of a balance of interests, social justice, and harmony.

All nature, the whole world throughout its existence solves in fact all the same, one and the same task — of the **exhaustive** *expression of developing content by a moving form*, spirally ascending by means of some of its elements (shoots, offshoots, curls), and the final solution of this task has not existed, nor does it exist. To see this all-absorbing movement, one needs only to look more intently at the world surrounding us, equally as at ourselves. All the more so since thinking is already "pregnant" with this concept; sooner or later this approach will be laid at the basis of a new world-understanding. Humanity will be forced to pass over to the practical application of the new model in the name of ensuring its own survival (as a separate definite level-form) in the competitive struggle and interaction with all the other forms-levels surrounding it. Year after year this is demonstrated ever more prominently by the rapidly growing *ecological* dependence and

vulnerability of man; for the following of the imperative of maintaining ecological equilibrium in the system {man/nature} is nothing other than the painful search by human thinking of the optimal (i.e., **the most contentful** for every concrete level-stage of development) *dialectically verified* **correlation** (*relative balance*) between the contentful and formal components in this system.

The new approach simultaneously testifies both to the limited applicability of the currently dominant anthropocentric (including sociocentric, and theocentric, if you will) model of the world, and to the necessity of transition to another, more integral and adequate model of it. Moreover, outside this approach humanity will not be able even *correctly* to untie the knot of the aggravating internal contradictions between the components in the relation {West/East}, let alone effectively compete with the forms-levels of its external surroundings (from the composition of the planetary natural environment, and then of near and far space). And, finally, this concept knocks the ground out from under the feet of any and every fanaticism and terrorism: there are no objective grounds for any exclusivity and "God-chosenness." Nazism, religious fundamentalism, "American exceptionalism," or "Banderism" (implying the illusory racial, religious, intellectual, or any other superiority of one nation or confession over another) are based *on the excessive absolutization and unjustified centrism of their forms*. *No exclusivity whatsoever is realizable in* principle by reason of the limitedness and transient character of any and every form; this conclusion must be brought demonstratively to the consciousness of people in order thereby to liquidate worldview illiteracy.

The algorithm of development is common and universal for all levels-forms, from the photon to the most intricate notional schemes and constructions in the heads of individual individuals: *new content will always strive to acquire a new form, and forms — to be filled, to be enriched with new content*. ***Hence — the vortex movement of everything and all***. The concept merely notes the typical, standard character of the course of things at all levels: the universal, generalized relation {content/form} is clothed at each concrete level in its own concrete form and "marches" in a through-going manner across the levels in the direction of the replacement of forms by ever more and more contentful ones.

Behind each *concrete* relation-form from the series of such, for example, *concrete* relations as: {movement/rest}, {time/space}, {acceleration/gravitation}, {energy/mass}, {field/substance}, {continuity/discreteness}, {wave/corpuscle}, {negative charge/positive charge}, {seed/fruit}, {male/female}, {masculine principle/feminine principle}, {spirit/flesh}, {personality/society}, {politics/economics}, {liberalism/conservatism}, {enterprise/inertness}, {intuition/logic}, {subjective/objective}, {abstract/concrete}, {function/structure}, {process/result}, {quality/quantity}, {change/basis}, {active principle/passive principle}, etc., etc., — hides the most *abstract* relation of

the components {content/form}. And now the investigation of the prospects of change, movement, development of the endless number of diverse concrete relations **conditioning the existence of various areas of multilevel reality** can be conducted already with the understanding of the essence of this movement-development, i.e., more effectively.

With respect to all concrete forms-relations (including the above-enumerated set), the noted movement @ in the direction of achieving *the highest contentfulness* means that in the course of the development and evolution of concrete forms-relations there is observed *a shift* toward *the increase* of the "specific weight," role, and significance of the contentful component (i.e., the "numerator" of the relation) in the composition of concrete forms-relations. At that, the *previously formed correlation* or *established balance* of the constituents (components) in their concrete relations is little by little violated, which periodically requires the search and establishment of a new correlation, a new position of the boundary of division between the components *in the concrete relations-forms changing in this way*.

In the course of studying the regularities of the development of relations of this kind, the role and purpose of *dialectics itself* becomes clearer — as **the art** of seeking out and establishing **the correct correlation** (or *balanced* position of the boundary of division) between the constituent sides in their concrete relations, conditioned (we are speaking of the correct correlation) each time by a definite stage of the development of each concrete relation (i.e., by its definite location in the chain of development). Until now and to this day the said task (of determining the correct correlation between the components in concrete relations) has been solved and is being solved exclusively intuitively, by touch, empirically... The concept, however, allows and proposes to do this more *consciously*, with the attraction of the enormous potential of human thinking, thereby ensuring the competitiveness of humanity in the confrontation with other forms-levels rivaling it.

Thus, *everything particular and concrete — these are separate forms into which the generalized abstract form of the relation {content/form} examined by us "dresses itself" in the process of its evolutionary movement @ through the levels*.
Acquaintance with the concept, which discovers the omnipresent presence *of content-form transformations* of known directionality, allows one to look with different eyes both at the Chizhevsky cycles, and at the Kondratiev cycles, and at Mendeleev's periodic law, and at the true roots of holism and Bogdanov's tectology, and at the phenomena of similarity, fractality, the anthropic principle, and at the meaning of the golden section, and at the essence of world constants, and at the numerous physical laws of conservation (of substance, energy, momentum, charge, parity, strangeness), and at the gender relations {men/women} [1, p. 55], and at the symmetry-asymmetry of the world (including the mirror and "chiral" symmetry of the forms of the animal world, of man, of his brain, internal organs and systems [1, pp. 13, 14, 25]), etc., etc.

Let us show in the most general terms (without detailing) the "work" of the model {content/form} and of *the principle of self-development* on the example of tracking the modifications of the forms of the animal world (including man).

Mollusks with their spiral-shaped shells — perhaps *the most visual* ancient specimens of content-form transformations in the course of the movement and development of the contentful constituent of reality at the level of the "living."

The mirror symmetry of living beings (the non-identity of the left and right halves of the body) likewise personifies nothing other than the content-form interaction of two sides, of two opposing components of one whole (organism) in the course of the entire life cycle of the individual (we are speaking of insects, reptiles, fish, birds, mammals, etc.). The mirror-reflected parts (branches of the coil of the spiral, see Fig. 1) of living organisms alternately, in the process of the life of the individual, perform functions of either a "purely formal" or a "more contentful" character.

The interaction of the mirror halves of a living individual accompanies the growth (accumulation) of the volume and the maturation of the deep content up to the moment of the transfer of this accumulated contentful volume in a "coiled," compressed, concentrated form to its offspring. Further, content-form transformations accompany the process of the mating of individuals, the fertilization of the egg (ovum), the origination of a new phase of the contentful principle and the continuation of its further movement in the same direction, but at a new stage (coil) of its development. Most prominently this process is represented by the widely known examples of the metamorphosis of insects (butterfly — egg — caterpillar — chrysalis — new butterfly).

An ant, a dog, a man — these are "shortened" spiral coils of the forms of reality, manifested correspondingly to different stages-levels of its development. If for the non-living (and even for some early, simplest forms of the living) one still has to contrive to discern this spiral coil (by virtue of its small curvature-intensity of development), then for developed living forms it is manifested in the most visual way and is too obvious.
The opposition of the left and right halves of living beings (which is most expressed in animals) unmasks the interaction of the contentful and formal halves of the coil in the process of the existence and development of the organism (see Fig. 1) and makes this interaction, like the coil itself, maximally visual and obvious. At that, the symmetry and equilibrium of the left and right halves of the organism — are ***only seeming***; in actual fact this is **the asymmetry** of two competing, non-identical, non-equivalent constituents-sides of one whole (Fig. 1), ensuring the movement-development of the organism as a whole.

For the entire animal world (including man) one can reveal, trace, and describe the content-form transformations in the most generalized form: the movement of content against the background of the content-form interaction of visually symmetric parts of the organism; further, the interaction of the components of "content" and "form" at the level of the relation {male/female}: mating, fertilization of the ovum, and the birth of a new contentful link in the form of offspring; and as a continuation — the reproduction of the next similar coil of content-form relations at a new level. Moreover, the absorption of one form by another form (the eating of living forms) in the process of the life cycle of the individual and the enrichment (feeding, nourishment) thereby of the developing content — also constitute the essence of content-form transformations at the level of the living.

The veil of mystery over the relations between man and woman (as two "halves" of the single whole of the relation {man/woman} — see Fig. 1), the sacraments of love and the continuation of the human race (including the acts of conception, the development of the embryo in the maternal womb, the birth of a child — see Fig. 1), as, incidentally, the riddles of gender relations as a whole, — becomes more transparent in the light of the representations of the content-form movement determined by model @.

At that, the development of each smaller fragment (constituent part) of this process, in turn, can be examined (and *requires* examination) from the standpoints of relations of similar sides (an example of this is, say, the content-form interaction of the branches of the spiral of the DNA molecule throughout its life cycle, the replication of molecules, the division of cells, etc.); processes of the same directionality proceed at the cellular, tissue, organ levels of living organisms, as well as at the atomic and molecular levels of organic and inorganic nature.

The incomprehensible until now natural symmetry of the "left" and "right" (characterized by the non-coincidence, opposition, and mutual complementation of the symmetric parts of the whole, and not only in the case of mirror, "chiral," or circular symmetry, but also in the case of other types of symmetry, including the specific symmetries of the physics of elementary particles and quantum mechanics), the interaction of electric charges and the phenomena of electromagnetic nature, the formulations of various laws of conservation and the conditions of the achievement of equilibrium or balance of the quantities (components-constituents-sides) of the relations under consideration in different areas of reality, the phenomena of all sorts of "periodic laws" and "similarity" (including the so-called "fractality" and "anthropic principle") also conceal in their depth the presence and development of spiral-cyclical content-form transformations of known directionality. [At that, owing to the "liveliness" and inexhaustibility of the mentioned relations-transitions, symmetry inevitably transforms into asymmetry, and the laws of conservation are violated at every turn, i.e., are fulfilled only in some approximation with the indispensable reservations-assumptions-limitations].

Within the limits of the plant world, one can judge the analogous character of transformations by the spiral-cyclical movement in the chain "plant — fruit — seed — new plant," by the external appearance and internal structure of trees, bushes, leaves, grass, flowers, fruits...

This same *principle of self-development* allows one to grasp the essence of the directionality of the modifications of forms also in non-living nature, to which, say, for over a century and a half the Periodic system of elements of D.I. Mendeleev (the periodic law of the variability of the chemical and physical properties of elements depending on their atomic mass) points us in its main features.

To see such development and manifestation of the essence of content-form relations in the non-living objective world is much more difficult than in the living, since the intensity of the development or transformations of the components-constituents of the relation {content/form} here is extremely low, and therefore the periods of such transformations (coils) stretch out sometimes not simply for centuries, but for millions and billions of years.

Let us examine, for example, how and what content-form relations determine the variability of natural landscapes.

It is known that the non-uniformity of the heating of various segments of the earth's surface by the sun causes the movement of air masses (winds, hurricanes, tornadoes, etc.). Even if one does not take into account other sources of changes (precipitation, earthquakes, thunderstorm phenomena, cosmic influences, etc.), the movement of air masses one way or another still changes the relief of the locality (the form of the surface of segments of the Earth). This tells on the change of the conditions of the heating of the surface, which, in turn, influence the intensity of the heating of the air and introduce their changes into the character of the movement of the masses of this air. The latter again is reflected in the relief of the locality and leads to the change of the picture of the heating of the surface. In this way, by means of the accumulation of definite local changes (even excluding the actions of tectonic and volcanic nature), different platforms with different climatic zones can be created on the earth's surface. The changed "form" of the surface (the relief of the locality) immediately begins to absorb the sun's rays in a new way and to assimilate their energy-"content" in a new way. This is expressed in the change of heat emission, and, consequently, in the change of the degree and intensity of the heating of the air above the surface. The latter circumstance, in turn, leads to the change (with respect to the preceding) of the character of the movement of the masses of air above the same surface and, correspondingly, to new changes of the relief (form) of the locality. Thus, the new "form" of the surface, as it were, follows the changing heat-energy-"content" of the surrounding air medium.
Repeatedly recurring changes of this kind over a long time lead, in the final analysis, to radical qualitative transformations — to the avalanche-like

following of the form after the contentful (in everyday usage — thermal, energy) changes, which means, in the end, a qualitative leap and the transition to a new cardinally changed form with a new volume of accumulated content. The result can be the complete destruction of the former form (landscape) and its replacement by a new one, or such its modification which promotes the even more intensive further following of the "form" after the heat-energy-"contentful" changes (in everyday usage — the establishment of an ever more flexible and close feedback).

Let us complicate the task. The interaction with heated air and solar radiation of the surfaces of different water bodies (rivers, lakes, seas, oceans, etc.) leads to the evaporation of the surface layers of the water mirror, which, rising above the earth, are cooled by the atmosphere and form clouds of water vapor. The formation of cloudiness in itself is a factor of substantial influence on the intensity of the heating of the locality by the sun's rays, which, in turn, tells on the character of the movement of air masses above the earth's surface. But this is not all. In the course of rising and cooling, the water vapors condense and the formed moisture, in the end, returns to the earth in the form of precipitation (rains, downpours, hail, snow). This circumstance causes the change of the outlines of shores, of the areas of water surfaces, of the depth of water bodies, of the speed and volumes of the transfer of soil by water, the appearance of new water bodies, and, consequently, the change of the conditions, character, intensity of the subsequent stage of the evaporation of water. The alternate alternation (or, more precisely, the "parallel-sequential" action) of the regimes of the evaporation of water and the falling of precipitation leads at times to substantial changes of the relief (form) of segments of the earth's surface and to the change of climatic zones. Thus, the "form" constantly, as it were, pulls itself up to the "content" of the changes taking place. Even without taking into account the influence of tectonic and volcanic activity, as well as of other cosmic influences, except the action of the sun's rays, one can see how the content-form interaction described above is expressed in substantial modifications of the "forms" (the change of segments of the locality, the displacement of climatic zones), following the heat-energy-"contentful" stratifications. From the standpoint of the described approach, by the way, the essence of such a well-known phenomenon as the water cycle in nature, studied in the junior grades of elementary school, is also understood more easily.

Now let us add one more factor accompanying the process under consideration. It is known that the formation of clouds is sometimes accompanied by their polarization (i.e., the accumulation in the cloud of electric charges of one sign). Upon the approach and collision (contact) of polar-charged clouds with each other or with the earth, powerful electric discharges (lightning) arise, which cause at times colossal changes in the surrounding environment and lead to the appearance of new forms. Such can happen again by reason of the change of the relief of localities because of fires, or owing to the formation of qualitatively new chemical compounds of

elements (from the composition of the earth's crust, water, air, etc.) under the influence of the high temperature at the place of the electric discharge. The arisen compounds of elements, having absorbed new contentful changes, themselves contribute to the accumulations of further content in qualitatively new forms. It is quite possible that it is precisely such electric discharges that led, in the opinion of scientists, to the creation of the conditions for the emergence of the prototypes of more mobile, more flexible forms adapted to the absorption and accumulation of subsequent changes, i.e., of "proto-living" forms and subsequently — of protoplasm. The form here unswervingly follows the contentful changes of the surrounding space, contributing, in turn, its own share to the volume of the contentful accumulations caused by this movement. In the final analysis, this can lead to radical changes of a contentful character in the form of cataclysms and the leap-like emergence of cardinally new forms. At that, not only the outlines (relief) of the former forms of the locality and the climatic conditions can change, but also compounds of elements with changed and previously unseen chemical compositions can appear, which, in turn, can become the cause of the emergence of new more flexible and mobile contentful structures and forms.

[Let us note that the examples adduced here are examined by us under the assumption of the absence of any elements whatsoever of living nature. The presence of living forms would undoubtedly accelerate the content-form transitions examined, which is what takes place in reality at the present stage of development.

Besides, the analysis adduced here is based on the examination of only factors belonging to the category of atmospheric phenomena. An analogous analysis can be conducted also with the examination of the consequences of the influence of other cyclical factors (such as, say, earthquakes with volcanic eruptions and tsunami waves, as the rotation of the Earth around its axis and its movement along the solar orbit, as the leaps of solar activity, as the collisions of the Earth with celestial bodies, etc.)].

All natural cyclical phenomena (for example, the change of seasons: spring — summer — autumn — winter) — this is nothing other than the spiral-like ascent of the content of reality by its renewed forms, i.e., the manifestation **of the same** veiled content-form movement in the direction of the absorption of the "developing content" by the "developing content" itself.
If one speaks of the regularities, say, in the sphere of economics and social development, then Marx's teaching on the change of socio-economic formations owing to the development of the productive forces and the inevitable entry of these forces into confrontation (contradiction) with the production relations (i.e., owing to the contentful outgrowing by the productive forces of the forms or frames of the production relations) — is nothing other than the description of the manifestation of the action in a concrete kind (form) and in a concrete area of reality of the same general tendency or generalized abstract model @.

Again, the productive and any other activity of man is directed at the creation of new forms of different levels in the expectation of the all-round and exhaustive coverage by them and the realization (in accordance with formulation @) of the "carrying-away" content in the image of the needs, desires, intentions, interests, will, aspirations, goals, schemes, ideas, theories arising in the consciousness (and subconsciousness) of man...

Billions of people daily, "every moment" consciously and unconsciously are involved in the same single universal process of content-form transformations and participate in the chase **by their "forms" after their own "content"** fleeing from them, in the hope and striving to clothe this "content" in the proper and befitting the current (or prospective) moment new or renewed (perfect) "form." And let these people move (both mechanically, and physically, and "psychophysiologically") in different directions, commit different deeds, perform various actions (lying, sitting, standing, on the run, moving in an automobile or airplane, etc.), the essence of their striving, movement, existence is **one and the same** — the taming of their restless, fidgety contentful "I" by clothing it in a correspondingly new and more suitable for this new content form (both in the form of speculative schemes and plans, and in the form of productive activity and its products, as well as in the form of all sorts of external mechanical movements, including the purposeful movements of various parts and organs of the human body).

Thus, the productive (practical-theoretical) activity of modern man in aggregate with the products of this activity (in the form of all sorts of *technologies* and *ideologies*) represents nothing other than the perfected, developed, complex *forms of manifestation of the same single changing reality, abiding at the levels of heightened contentfulness and having come to replace* and as **a continuation** of the forms of the original (simple) labor and cognitive activity of early man in combination with its primitive primary results.

The formulated *principle of self-development* is internally naturally and organically inherent both in us (man) and in all our surroundings. *The content-form transformations of unitary directionality lying at the basis of all real processes*, described here, not only explain the spiral-cyclical character of these processes, but also allow one to forecast their development.

One can additionally adduce a great multitude of examples interpreting the action of the universal *principle of self-development* @ at different levels of the content-form movement of reality: this internal principle ignites and extinguishes stars, rotates the Earth, moves across the surface of the planet the masses of soil, water, and air; it also "hides" behind the external appearance of vortex atmospheric and oceanic currents and formations (well distinguishable on weather images from near space), of processes of volcanic nature, of the processes of the formation and shaping of planets, stars, galaxies, nebulae (on photographs of far space in the overwhelming majority

of cases the patterns of spiral-like branches of the so-called interstellar and intergalactic substance catch the eye); this same principle stands behind the transformations of chemical elements and compounds upon the change or loss of orbits by valence electrons at the atomic and molecular levels; it also drives "in a circle" the herds of wild animals and flocks of migratory birds; thanks to the realization of this principle people are born, live, communicate with each other, embody in life their intentions and plans. Everywhere visually and speculatively the spiral-cyclical character of really proceeding processes is noted, behind the facade of which are hidden *the content-form transitions of known directionality*.

We (humanity), equally as all our surroundings, are embraced and simultaneously permeated by this principle, constitute its essence and represent it in phenomena, are in its power, are subordinated to it, and it is we who permanently renew and reproduce it. And no ***external*** act of creation and control on the part of some "creator" or "maker" is required for the realization of this ***internal*** principle. The world is relatively simple and uniform **in essence** (by the principle of organization, the mechanism or algorithm of the movement and development of content), but infinitely complex and diverse in its manifestations **by form** — owing to the natural, unimaginable in details mutual interlocking, interweaving, and ingrowing of forms-levels into each other in their interaction.

Moreover, in the light of the concept expounded here, the universal and all-embracing Absolute in the form of an eternal, unchanging, finished, and perfect abstraction ***is unrealizable in principle***, since everything existing, in the final analysis, is **a process** *to a much greater degree* than some result fixed once and for all, than some finished formation, than some perfect "construction," than some "boundless-limitless essence," etc., etc. The Universe, equally as all its separate elements, *is made, recreated, reproduced, and renewed every moment*, in real-time mode, being modified, existing, and coexisting in the form of changing forms.

With an eye to what has been said, it becomes obvious in what manner one should relate also to the question of the cognizability of the world. Since the world, the Universe is incessantly and non-stop "made," "recreated by winding," and does not represent a sort of suitcase with books, the cognition *of the making*, *every-moment-reproducing* world — this is all the more an infinite and infinitely fascinating contentful process. How can one speak of some all-round, full, and final cognition of the world, if the world incessantly "unfolds" in ever new and new contentful forms? In such a cross-section it is more reasonable to speak of the cognizability and cognition of the world *as of the perfection of the possibilities* for the anticipation of such an "unfolding" of forms, of the possibilities for the foretelling of the emergence of new and the tendency of the change of existing forms, i.e., of the forecasting of coming events and their consequences, speaking in the habitual everyday language. *The effective forecasting of the development of the forms of reality — this is the prospect of the contentful development of humanity*.

The representations of development expounded above are directly connected also with the question of the elaboration of the methodology of the investigation and cognition of the surrounding world. We are speaking of the creation of a more or less universal form-algorithm of the investigation of the development of any objects, processes, and phenomena in different areas of reality [1, p. 66; 20, p. 36]. The revealed general objective regularities of development serve simultaneously *as the single unifying foundation for all the sciences and areas of knowledge existing at the present time*.

The principle of self-development (self-organization), which is the central core of the proposed concept of development, easily lends itself to mathematical formalization (by way of reduction to recurrent dependences and the organization of iterative-cyclical computations by the method of successive approximations), which allows one to hope for the construction of more perfect and effective (than those existing at present) prognostic models of the development of reality (or, in the habitual terminology, models of the surrounding world). One can suppose that the most complex and interesting moment in the course of the creation of the corresponding mathematical models of the investigation of the spiral-cyclical development of this or that form of reality will prove, in all probability, to be the solution of the question of the all-round account of the consequences of *the interference* (superposition, intervention, and influence) of the multitude of similar spiral processes of the development of all sorts of neighboring and accompanying competing forms.

The identification of the process of cognition with the process of the contentful multilevel movement-development of reality by way of the change of its forms-levels in the direction @ allows one to speak confidently of the achievement of a certain meaningfulness in the realization of the process of the cognition of reality itself.

As one can notice, there are described here mainly the general principles of the organization and development of reality (including the process of its cognition). It goes without saying that it is impossible without the participation of professionals to correctly adapt the general propositions to the numerous specifically-oriented areas of knowledge. This part of the work is within the power only of "narrow" specialists. At the same time, acquaintance with the general principles will considerably facilitate for any specialist the sorting-out in the existing interweaving of specific forms-relations of different levels forming the sphere of his professional interests.

Afterword

In our days, in scientific circles there is widespread a rather biased and arrogant attitude toward *the subjective* and *the ideal*. And meanwhile, by what other path, if not as a result of the "construction" by individual individuals of subjectively-abstract ideal forms, is *the universally significant*

and *universally* accepted built up in the course of successive approximations to the reproduction of *the most objective* of all (i.e., the objective content of reality)?

One should not think that everything expounded above belongs only to the category of exercises in the construction of empty ideal *abstract* constructions. Most concentratedly today the essence of even *the most pragmatic* concept (theory, teaching, etc.) can be expressed only by means of *conceptual* (notional) formulations, i.e., by means of *abstract* ***subjectively-ideal forms***.

The region, the medium, and, finally, *the level of the ideal* — this is that "space" into which modern man lays out everything *most significant*, *most contentfu*l, that he alone can dispose of today. And goals, and methods, and schemes, and decisions, and conclusions, and models, and images, and pictures, and plans, and programs, and ideas, and theories, and teachings, etc., etc. — all this is from the region of *the ideal* (which is likewise merely a **form of the next approximation** to the most complete expression **of the objective content** of developing reality).

One more argument in favor of the significance of *the ideal* for man consists in the fact that without an idea and, in a broader sense, outside ideology, man simply "becomes brutish," reducing his life to the stuffing of the belly and the performance of natural needs, i.e., to a "looped" existence at "earthbound" levels.

It is precisely with reliance on ***the contentful ideal*** constructions being built that the speech here is about nothing other than *the prospect of the development of humanity*. In times when, behind the infinitely-routine everyday cyclicality, man sees no meaning in life and in his existence, there opens up the possibility of looking at all this with completely different eyes. Every man is not simply capable, but obliged to become a researcher. In each of us slumbers the subconscious striving to "contrive to peek around the corner" (satisfying his innate curiosity), to foretell the onset of events, to forecast and anticipate the appearance and development of new forms. One needs only to activate this slumbering natural striving and impart to it a new impulse, i.e., consciously bring it out to a new level.

The approach described here is called upon to aim man not simply at the cognition of a certain world existing from time immemorial, but predisposes to the meaningful investigation of everything that "is being made," that "is being reproduced" and "recreated" directly here and now — in real-time mode both in our near and far surroundings.

To date there exist a million concepts of the world-order. Everyone builds his own model (picture) of the world in his own way, proceeding from the knowledge and experience both of his own and of preceding generations. Hence grow the most diverse variants of world-understanding, a series of

which proves to be among the dominant models of the world-order accepted by social consciousness. Being in actual fact ***different*** *approximations* to one and the same, many of them at first, and sometimes for quite a long time, ***seem*** *equivalent* — go figure which variant correlates more precisely with developing reality... But only until the time when obvious failures and irreparable losses begin in the making of decisions and the realization of the corresponding actions in the channel of following this or that *universally significant* model. And only then, when the problem of the survival of humanity (or at least of its part) is pushed to the foreground, does the question of the assessment of **the adequacy** of the existing world-understanding rise to its full height, i.e., the assessment of **the sufficiency** *of the level* (*fullness*) of **the objective contentfulness** (**objective content**) of *the ideal model* "chosen" previously as the guiding star. **Inadequate** (*low-contentful*) thinking (with all its *low-contentful non-true* abstract subjectively-ideal forms-models of reality), having as its foundation including false premises and sincere delusions, sooner or later risks being punished by the premature termination of existence and the disappearance of the very form of humanity owing to the "dragging-apart" into parts, the absorption and assimilation of this form by *more contentful* competitors. Taking into account the circumstance that there are no two or more equally contentful and equivalent "truths" or points of view regarding one and the same subject of judgment or investigation (i.e., there do not exist *in principle identical and equal-sized approximations* to the absolute truth), one must clearly realize that the acuteness of the question of the assessment and choice by man of the most contentful (true) and most adequate variant of decision from among two or more such variants will never be blunted or lost. Meanwhile, *the inadequacy of the perception of the world leads man to catastrophe* — one wants to think that someday this thought will take possession of the developing human consciousness and become its topical and habitual content. *In such a connection it is difficult to overestimate the significance of the decisions made by man (as well as the measure of his responsibility) in the choice of this or that* ***ideal*** *model of the development of reality*. Such is *the far from harmless role* of every, it would seem, insignificant *subjective ideal*.

Much of what has been expounded above, as has already been noted, is presented in various sources of scientific and philosophical literature in parts. However, such a *concentrated* exposition of separate views and representations *in the form of an integral single concept* is reproduced for the first time — everyone who is accustomed to systematically tracking scientific and philosophical publications of the indicated directionality can verify this.

The ever-growing number of examples of the interpretation and confirmation by factual material of the conceptual propositions formulated above gives grounds to consider that the worldview concept presented here proves *to be* ***today*** *the most contentful and adequate*.

ARTICLE 2

The Nature and Meaning of Fundamental Constants

Abstract

The description of the most general and many specific regularities of the development of the surrounding world is seldom managed without the presence of the so-called world constants — universal values entering into the composition of the form-building means of such a description (mathematical formulas, mathematical dependences, mathematical expressions).

A great multitude of printed works is devoted to these values, and, despite the abundance of investigations of their remarkable properties and characteristics, the circumstance is universally recognized that until now the true nature and the actual meaning of the fundamental world constants are unknown to anyone.

The present work removes the veil of mystery from the very popular and extraordinary numbers **π**, **e**, and **φ**, to the solving of the secret of which numerous publications in various information sources are devoted.

On the example of these three most ancient and omnipresent numbers, the article shows in what manner one should approach the establishment of the nature and the revelation of the meaning of constants of this kind.

The work can be recommended to the attention of researchers as initial material for the study of the background and the elucidation of the meaning of the entire spectrum of existing fundamental constants, as well as as a source of alternative views on the nature and essence of the surrounding world.

Introduction

Many versions are known regarding the origin, purpose, and role of the fundamental world constants. We are speaking, first of all, of the most ancient constant "π" [2, 10, 11, 13, 17, 20, 22, 28, 34, 51, 52] — the designation and numerical value of the ratio of the length of the circumference to its diameter, as well as of the no less fundamental and popular (although not so ancient as the first) constant "e" [2, 8, 10, 11, 17, 20, 26, 29, 31, 43, 51, 53] — the designation and numerical value of the base of natural logarithms. In this same connection we shall not fail to recall yet one more outstanding constant "φ" [1, 2, 3, 7, 14, 19, 23, 25, 35, 39, 40, 47, 50, 51] — the designation and numerical value of the so-called golden ratio, or golden section, or golden proportion.

To the extraordinary and mysterious (not to say — mystical) numbers **π** (pi), **e**, and **φ** (phi) a great multitude of printed works is devoted. Special attention is traditionally paid to the enumeration of the astonishing properties of these dimensionless constants. And at the same time, despite the abundance of investigations and descriptions of the remarkable characteristics of the indicated numbers, the circumstance is universally recognized that until now the nature and the actual meaning of these values are unknown to anyone.

In contrast to the mission of replenishing the list of enthusiastic descriptions of the wonderful properties of the above-enumerated world constants, the modest task of the present article consists in showing the source of their extraordinary properties, in uncovering and laying bare the true nature and essence of these values.

We shall solve the set task, relying on *the concept of development* described in the previous article of this same collection, as well as in the works [5, 21, 54].

In investigating the essence of the mentioned constants, we proceed from the fact that reality (the world surrounding us, nature) is always at least two-sided (dual). Any object, process, phenomenon in the most general abstract form represents a relation of two sides-constituents-components: **{content/form}**. Then any concrete form (implying under itself the same object, process, phenomenon) is determined by the correlation of the indicated sides-constituents in each of their concrete relations. The development of the forms themselves represents the change of the correlations of the noted constituents within the framework of their relations.

In such a connection it becomes obvious that the forms determined by the above-mentioned correlations can be both more and less *contentful* (by virtue of the presence of *different shares* of the contentful and formal components in their relations). The general tendency of the development and change of forms (as the experience of human observations throughout human history shows) is such that in the course of their (the forms') development there takes place *a shift* of the correlation of the components (in their relations) toward the "numerator," i.e., toward the *contentful* component (what is meant is the principled orientation toward the general movement-development of forms in the direction of the acquisition of *the highest contentfulness*) [5, 21]. Such an installation-orientation is called *the principle of self-development*, with the formulation of which the reader can acquaint himself there — in the previous article of the present collection and in the works [5, 21, 54]. This formulation means approximately the following: *everything that exists and develops has as the direction of its development and existence the expression (coverage, absorption, assimilation, comprehension...) by itself, existing and developing, of itself,*

existing and developing. And such directionality or orientation of movement-development is inherent in all developing forms without exception.

In the text of the article the reader will not encounter a single formulaic expression for the determination (calculation) of the values investigated by us, just as he will not see "juggling" with their numerical values, which at present have the possibility of being reproduced with any preassigned accuracy. The demonstration of such effects does not add, unfortunately, clarity in the intention to find out the true nature and meaning of the constants under consideration: for no matter how many times one says the word "halva," it will not become sweeter in the mouth. For us in this case the most important thing is to uncover and manifest the deep philosophy of these phenomena, i.e., to reveal the essence, meaning, background, nature, and the urgent necessity of the use by man of these parameters (values) in his activity. The possibility of the solution of this task is determined by no means by the skills of mastery of the craft, but by the level of mastery of the art of "aerobatics," i.e., ***dialectics***.

Without being distracted by the description of the astonishing properties and characteristics of the dimensionless constants under consideration (these properties are enumerated and described in abundance in the literary sources by the references mentioned at the very beginning and in many, many others), let us stop on the main, in our opinion, question: in what, strictly speaking, consisted and consists for man the urgent need or necessity of the introduction of these numbers into everyday use, into practice, into circulation? In other words, we shall answer predominantly such a question: what main problem for himself did man attempt to resolve (let it be unconsciously, unthinkingly, intuitively) by way of the introduction of these numbers into practical circulation? At that, let us note that, answering these simple questions, we shall inevitably have to answer also the more general question: what fundamental regularity of development leads to the necessity of the seeking-out and use of such constants?

In two words and still very simplistically, the answer to these questions will look approximately as follows.

When man does not know something, does not understand or under-understands it (i.e., encounters something unexplored, both in the small and in the large), he strives with all his might to express this unknown through the known and cognized, — let it be not so smoothly and thoroughly, not completely, but with some "appendage" of the not quite ordinary (say, through some atypical or unknown — until the time — *combinations* of known forms), but still mainly through the habitual and already familiar. And this means that in such cases man is moved by the striving — to clothe the new developing content (new knowledge) in a more or less known form, to impart to this new content (new knowledge) a more or less already meaningful and habitual appearance. Therefore, however strange this may look, not only at the first steps, but always in such cases human thinking

solves the main *philosophical* problem for itself of the seeking-out and clothing of the renewing and accumulating *content* of developing reality in a form more or less (and in the limiting expression — *in the most and maximally*) answering to this content and simultaneously "digestible" for comprehension. In the same cross-section, the *initial internal contentful* human activity or aspiration seeks embodiment or expression through the external *formal pragmatic* execution; at that, the *contentful* side in this tandem (**relation** *of the contentful and formal components*) always proves to be the leading and moving side. Probably, for the majority of us this assertion abides in a still insufficiently manifested and not fully realized form, but the matter stands precisely so!

Now let us pass over to the detailed examination of what has just been said with respect to the numerical constants of interest to us.

§ 1. Let us begin with the number "π" (pi)

As is known still from the school bench, the number "π" represents the ratio of the length of the circumference to its diameter. This is the most distinctly manifested relation of two sides-constituents of reality, for which are characteristic in this case such basic relations of its properties as {curvature/rectilinearity}, {continuity/discreteness}, {boundlessness/limitedness}, etc. In each of the noted relations there are present and mutually linked two sides-constituents of reality. However, notwithstanding the closest interconnection, neither the one nor the other side is identical to the other and represents components not replaceable by each other; at that, to such a degree not replaceable that between these sides-components there always lies a naturally conditioned boundary of division. Human thinking comparatively easily copes with the realization of the *formal* side of such relations, i.e., of the "denominator," and matters stand much worse with the perception of the *contentful* side — the "numerator."

Proceeding from this, from the most ancient times everything still not understood and incomprehensible man trivially strives to express through the already understood and comprehensible. The relations adduced above in this sense are no exception. In his attempts to express, to comprehend the incomprehensible continuity and boundlessness of the curvature of the circumference through the comprehensible limitedness and discreteness of its rectilinear diameter, man inevitably comes to the sought relation, expressed and designated by a certain from time to time approximately repeating numerical value (subsequently named the constant "π"): in a rather obvious and unpretentious way he manages to express the incomprehensible *irrational* through the well-known and sufficiently studied rational.
Thereby, in the image of the number "π" we find the first *productive* attempt of man to cope with quite serious difficulties, which are conditioned by the objective presence of two objectively opposing and non-interchangeable

sides of reality [5, p. 55]. This is an undoubted achievement and victory of man, but not without subsequent disappointments.

Perhaps the simplest algorithm (way) of finding (computing) the constant "π" reduces to the seeking of the limit of the ratio of the perimeters of the regular polygons inscribed in the circumference and circumscribed (around it) (with the unlimited increase of the number of sides of these polygons) to the diameter of this circumference. In this way is realized the striving toward the expression of the most *contentful* correlation between the contentful and formal components in their relation **{length of circumference/diameter of circumference}**, indirectly determining, in essence, also the correlation between such fundamental sides-components of reality as **{curvature/rectilinearity}**, {continuity/discreteness}, {boundlessness/limitedness}, etc.

The straight line and the circumference — these are the two most popular lines on the plane of the times of the absolute leadership of geometry among all the sciences then being born. Between the two remarkable lines — the circumference and its diameter — is enclosed a whole family of broken lines (polygons) inscribed in the circumference (and circumscribed around it) with perimeters easily computable and arbitrarily closely approaching the length of the circumference. An excursion into history shows in what unpretentious, but quite laborious way rational man approached the comprehension of *the irrational*: Archimedes, as is known, in his computations went as far as the calculation of the perimeters of the 96-gons inscribed in the circumference and circumscribed around it [42, p. 43; 52]. And, despite such laborious and painstaking work, to express the length of the circumference *wholly and without remainder* through its diameter still did not succeed [18, p. 291; 24, p. 131; 51, pp. 33–34]. All subsequent attempts of new times only confirmed the unsolvability of this task in an *exhaustively* exact expression. Today the constant of interest to us has already been computed with an accuracy of up to billions of significant digits after the decimal point [20], but in the final form the task has still not been solved. What does this speak of? Only of the fact that in the course of investigations of this kind man has come up closely against the inexpressibility of the real (really existing) *irrationality* by a simple *rational* way, even in the case of a deliberately limited, so-called flat geometric space.
Alongside the testimony of the achieved victory, corresponding to some smallish possibility of representing one through the other, the number "π" — this is at the same time also an indicator of the futility of the attempts to achieve the *final* and *complete expressedness* of the objective boundlessness, continuity, curvature through the no less objective limitedness, discreteness, rectilinearity.

The inexhaustibility and progressive productiveness of such attempts, but at the same time also the *principled* unattainability of the expression of the entire fullness of content in a final kind and form are interpreted and substantiated by the above-mentioned formulation of *the principle of self-*

development, which proves to be the background of that very (sought) regularity of development leading to the necessity of the seeking-out and use of this constant.

In the indicated connection, the meaning of the constant "π" is seen in the fact that it fixes a certain *transitional* ("borderline") numerical correlation between the contentful and formal constituents in the relation {"curvilinear" circumference/"rectilinear" diameter}. In this case human thinking contrived to express in a quite definite manner — by a more or less concrete number — the correlation between curvature, boundlessness, and continuity (the personification of which is the curved line of the circumference), on the one hand, and rectilinearity, limitedness, and discreteness (personified by the rectilinear diameter of the circumference), on the other hand. And in this same case we state by no means a final and exhaustive, but still a productive attempt of thinking to throw a bridge from the *rational* reality (from the standpoint of traditional human thinking) to a reality to some extent irrational (the term "***irrational***" is used here in the meaning of something not fully cognized, insufficiently investigated, and comparatively more contentful, not yielding to realization in full measure, and not in the sense of something mystical and otherworldly). In the striving to express *the irrational* through *the rational* (i.e., to throw a "little bridge" from one to the other) and appear the remarkable relations, similar to the number "π". By reason of the objective unattainability of the full and exhaustive expression of the irrational through the rational (the infinite through the finite, the continuous through the discrete, the indefinite through the definite, the abstract through the concrete, etc.), such relations are expressed and displayed by irrational numbers (i.e., infinite non-periodic fractions). The very irrationality of such numbers-relations (inherent in the dimensionless world constants under consideration) always presupposes, as it were, a long (infinite) "run-up" before the "jump" from the *formal* side-constituent of the relation to its more contentful side-constituent (for example, from the straight line or plane to the circumference or sphere in the case of the determination of the number "π").

Just as any natural formation, man and his thinking are at least two-sided (dual), and therefore contradictory. By virtue of the indicated peculiarities, even such a powerful instrument as abstract human thinking with its characteristic enormous intensity of the realization of content-form transformations proves unable to solve such tasks, ***moving exclusively in measured-gradual steps***; only by *a leap* in thinking (i.e., *at the level of the forms-concepts and representations mediated by human thinking about the contradictory components of reality in their actual relations of interconnection and mutual transitions*) is the barrier or boundary of division between the opposing sides-components of reality overcome.

Whether we want it or not, dialectics is present here and further, as they say, at full height.

From the set of information about all sorts of investigations of the number "π" it is known that there exists a multitude of curves of different orders, somehow correlating with the segments of straight lines connecting the ends of these curves on the plane, but only the ratio of the length of the circumference to its diameter is the most large-scale and "full-blooded" in magnitude (i.e., *the most contentful*) of all such relations. *The highest contentfulness* of the relation-form expressed and designated by the number "π" (as the ratio of the length of the circumference to the length of its diameter) is conditioned, first of all, by the remarkable property of the "numerator" of the relation, i.e., of the circumference; as mathematics asserts, of all closed curves of given length on the plane the circumference bounds the region of maximal area [2]. From the outstanding contentful fullness of the circumference and proceeds the intuitively-practical interest of man in the calculation of the length of the circumference by means of its diameter — in the striving and hope of the finding of a simple device for the exhaustive expression of the irrational curvature through the rational rectilinearity. Let us keep in memory this remark about *the highest contentfulness* of this wonderful correlation of the two components under consideration in their relation.

Thus, of all the correlations between the components of reality in the general relation-form {curvature/rectilinearity}, the number "π" represents such a special correlation of the components in their particular (and most kindred to the general) relation-form {length of circumference/diameter of circumference} which answers *to the maximally possible contentful filling* (or the highest contentfulness) of this form-relation.

At that, the irrationality of the number "π" testifies to the *principled* impossibility of the establishment in *exhaustive* form of the final numerical correlation between the components of the relation-form {length of circumference/diameter of circumference}, corresponding to its maximally contentful filling, and thereby to the impossibility of the acquisition of *the highest contentfulness* by this form-relation.

The impossibility of the exhaustive expression of the highest contentfulness by the indicated form-relation is ascertained in the course of the modeling of the process of the acquisition (achievement) of this *highest contentfulness* by the procedure of the computation of the correlations between the perimeters of the polygons inscribed in the circumference (or circumscribed around it) and the diameter of this circumference with the unlimited growth of the quantity of the sides of the polygons.

The productively realized attempt to link two independent and non-interchangeable sides of reality proves subsequently to be in demand in the plan of the use of the found *compromise* number "π" in all other cases which one way or another require the replication of similar "borderline" values for the adequate description of more complex real situations. Thereby the number "π" belongs to the series of remarkable and extraordinary numerical

correlations thanks also to the need for it for the subsequent application in the composition of formal (formulaic) expressions and dependences describing the development of diverse (including compromise) real complex forms and processes. The presence of the constant "π" in such descriptions indicates the belonging of the forms and processes described with its help to the number of *optimal* (i.e., endowed *with heightened contentfulness*).
Examples of diverse tasks in the solution of which the number "π" participates as a constant for the description of various kinds of *optimal* forms and processes can be found, say, in such printed works [6, 10, 11, 16, 24, 27, 30, 32, 33, 38, 46, 48, 49].

§ 2. Let us pass over now to the investigation of the constant "φ" (phi), responsible for the so-called golden ratio, or golden section, or golden proportion

The main peculiarity and rule of the construction of the golden proportion are more or less precisely, in our opinion, conveyed by the words of I. Kepler, who called this proportion itself continuing itself: "It is arranged so that the two junior members of this endless proportion in sum give the third member, and any two last members, if one adds them, give the following member, with the same proportion being preserved to infinity" [15]. This quotation describes a special algorithm of the composition of the whole from the aggregate of parts.

Continuing to answer the question posed at the beginning of the article — what fundamental regularity of development leads to the necessity of the seeking-out and use of such a constant and of the golden ratio displayed by it, — we state that this regularity too is conditioned by the above-mentioned *principle of self-development*.

In the course of the realization of this principle, the universal internal mechanism (algorithm) creates ever more "living" (i.e., ever more contentful) unique natural forms-formations. Submitting to the single principle of the exhaustive expression of the whole integrity of the developing content, nature by successive approximations solves the task of the coverage, representation, and comprehension of this contentful integrity by a totality of ever newer and newer forms. In this concrete case investigated by us, the role of the contentful and formal constituent sides in the generalized abstract relation {content/form} is played by the components **{whole/part}**.

Nature, as a definite-level external formalization of the developing reality, constantly gropes for the most optimal way of solving the indicated task. By the empirical path (by way of the realization of numerous approximations) there are produced forms which most correspond to the requirements of the exhaustive in the final analysis solution of the mentioned task, i.e., *the most contentful* forms. Forms-relations reproduced on the basis of the golden correlation between the components of these relations stand in the row of

such most contentful forms for their levels. The developing reality is capable, ***through human thinking*** *as yet another link-form in the chain of forms of its contentful development*, of fixing and evaluating the degree of contentfulness of its own (both already existing and newly arising) links-forms in the striving of the latter toward the possession of *the highest contentfulness* on their levels.
What is characteristic of *the heightened* (and in the limiting case — *the highest*) contentfulness, and in what does it express itself with respect to the forms-relations endowed with it? At the level of human consciousness the mentioned *contentfulness* of the correlation displayed by the number "φ" and the effectiveness of the chosen path are evaluated and confirmed by the maximal density of the "mastering" (i.e., the "best mastering") of free space by separate forms [2, 15], as well as, by virtue of this circumstance, by the establishment of the presence of the indicated correlation in a whole series of natural formations-forms-relations [1, 3, 14, 19, 23, 25, 40, 50, 51].

As in the case with the remark (see earlier) kept in memory about *the highest contentfulness* of the correlation designated by the number "π", with respect to the number "φ" the speech likewise goes about forms with correlations (between the components {whole/part} in their relation) answering to the expression *of heightened contentfulness*. The golden relation-form differs from other relations-forms by such a correlation of the contentful and formal components which ensures *the maximal filling with content* of this form-relation at the given (this or that) stage-level of its development.

A similar remarkable correlation is fixed by a certain number "φ" in the row of all other numerical values corresponding to all other correlations within the framework of the relation under consideration. And the matter, perhaps, is not even in some concrete numerical value of this correlation, but in the fact that such a remarkable correlation exists *in principle* among the multitude of correlations and of the numerical values corresponding to them.
The special correlation of the contentful and formal components, ensuring *the maximal contentfulness* of the golden forms-relations, endows these forms with heightened stability and viability. For the expression of the remaining advantages of such outstanding forms-relations, and in fact for the evaluation of the degree or measure of their *internal contentfulness*, man has invented and uses in everyday life a great multitude of all sorts of epithets and definitions (directly linked, among other things, with the aesthetic principle manifesting itself at the level of external human emotions), such as, for example: divine beauty, perfection of form, ideality, exceptionality, uniqueness, harmony, optimality, special property, high quality, "pleases the eye," and many, many others. The heightened (maximally attainable or highest for its level and stage of development) *internal contentfulness* of such forms-relations, expressing itself in a set of their remarkable *external characteristics* and properties, is connected with the presence, as already noted, of the above-mentioned concrete numerical correlation in a whole series of nonliving and living forms known to man. Confirmation of this can

be found in numerous literary sources (see the references above and below) devoting excessive attention to the description of the wonderful properties of the golden section. Coming to such a kind of optimal correlations in a series of certain forms, nature from year to year continues by spiral-cyclical movements to "polish" its creations, achieving results still more astonishing and still more approximated to the expression of *the highest contentfulness*. In such a way the developing reality itself, through the host of its changing and newly arising forms in the channel of the algorithm (formulation) *of the principle of self-development*, ***by periodic*** reciprocating movements "refines" the value of this correlation in the relation {whole/part}.

Meanwhile, human admiration, deification, and exaltation of the known properties represent a reaction of man only to the *external* signs of the manifestation of the *internal* contentful fullness of such special forms and leave without due attention this very internal contentfulness. Not being sophisticated in such questions, man is inclined to absolutize and mystify everything that is above his understanding, taking the superficial phenomenon for the innermost essence. And the golden section as an *external* manifestation of the heightened *internal* contentfulness of definite forms is not an exception in this case.

So, in what, in fact, does the divinity of the forms-relations reproduced by the algorithm of the golden proportion consist? Only in the fact that precisely such a correlation, such a proportion of the part and the whole ensures *the maximally possible contentful filling* of this or that form at a definite stage of its development, i.e., at this definite segment of its path the given form is *most contentful* (stands out from the other forms by its *heightened contentfulness*). The loss or forfeiture by a form of a part of its heightened internal contentfulness at another segment (stage) of its path inevitably leads also to the change (or disappearance) of the corresponding external signs of this form.

As in the case with the number "π", the establishment of yet another remarkable correlation "φ" between the contentful and formal components in their relation is, undoubtedly, yet another victory of *rational* man. About the special relations of the whole and the part man has reflected from time immemorial. The ancient Greek philosophers (beginning with Plato) supposed that the whole does not reduce to the simple sum of its parts. But all the most important suppositions and conjectures in this connection to this very day abide in the category of the theoretical (not to say scholastic) and have neither the status of recognized knowledge nor practical application. The official encyclopedic editions likewise limit themselves to very meager and vague utterances on this score [45, p. 768; 37, p. 1500].

The whole — this is not a simple sum (or totality) of its parts, but plus yet *something* else, obtained as a result of the interaction of the parts among themselves and of the parts with the whole. **When the whole grows by parts in such a correlation with the whole as is prescribed by the**

algorithm of the golden division, then the forming whole (under which are implied both the newly arising and the changing forms-relations) **acquires the maximal contentful filling. Thus, the number "φ" is a quite concrete quantitative correlation between the whole and the part in certain relations-forms, answering to the maximally possible contentful filling of these forms-relations in the course of their growth by parts in the mentioned quantitative correlations with the whole at certain definite stages-levels of the development of these forms-relations.** Precisely this correlation (this proportion) of the whole and the part answers to *the highest contentfulness* of the whole growing by a part in the indicated correlation.

The regularity of the construction of the golden proportion described by Kepler in an astonishing way resembles the sequence of Fibonacci numbers. Astonishing, however, only at first glance. The abstract and, it would seem, unconnected with practical application numerical sequence of Fibonacci is nothing other than a **model** of the *optimal*, most *contentful* growth of the whole by parts, i.e., a model of the modification of existing and the formation of new forms of *heightened* (in the striving toward the highest) *contentfulness*.

[A passing remark. Mathematics is excessively full of surprises, sometimes considered products of the fruitless play of a brilliant mind, but having, however, a direct relation to the objective reality, although not always an obvious one. The whole matter is in the excess, speaking simplistically, of the intensity of the content-form transformations at the level of human thinking over the analogous intensity at the level of the subject-practical activity of man, in consequence of which many *contentful* developments of the "pure" reason gather dust on the shelves, humbly awaiting their "binding" and demand at the level of *formal* practical embodiment.]

It should be especially noted that under the term "golden section" and its numerical value there hides a boundary correlation between the components of the whole and the part with its (the correlation's) limit, guessed in the perspective of the infinite growth of the totality of the constituent parts in the whole, modeled (the speech is about the growth) by the ascending sequence of Fibonacci numbers.

The analysis of the tendency of the change of the values of the relations of the neighboring members of the Fibonacci sequence, lying in the basis of the search for the most contentful correlation between the whole and the totality of its constituent parts in concrete forms-relations built after the type of the golden section, testifies to the fact that the increase of the number of parts included in the whole leads to the refinement of such a correlation and to its ever greater optimization, but the obtaining of *an exhaustively exact numerical value* answering to the most optimal correlation, even with an arbitrarily great (unlimited) growth of the quantity of parts in the composition of the whole (as also with the proportional increase of the

geometric dimensions of the whole and the parts), is impossible neither practically nor theoretically. In other words, the contentfully fulfilled whole is *uncountable* (does not yield to counting) and *inexpressible wholly and without remainder* by any number of limited parts and their totality; with the unbounded increase of the number of parts entering into the whole, modeled by the ascending Fibonacci sequence, the relation of the neighboring members of the sequence arbitrarily closely approaches a certain limit, but never attains it. Only in such an *unfinished* way and in an *approximate* manner is expressed (and can be expressed) *the contentful fullness of the uncountable whole through the infinite succession of countable totalities of its parts.*

Thereby the analysis *in the indicated connection* of the unending sequence of Fibonacci numbers allows coming to an important conclusion about the principled unattainability of the *exhaustive* expression of the content of *the whole* by any formal *totality* of its *parts*, even with the unlimited increase of the quantity of parts in the totality.

Continuing the investigation of this model (i.e., analyzing the variability of the values of the relations of the neighboring numbers of the Fibonacci sequence), one can discern also the presence here of a certain *likeness* of *forms* developing at different levels with different volumes of contentfulness (with the variation of the number of parts or of their sizes in the composition of these different-level forms), but *the repetition* (i.e., the equality or identity) of *forms* belonging to *different* levels with *different* volumes of contentfulness is *unrealizable and impossible in principle*! About this again testifies the infinite *incompleteness and unattainability* (in computation) of the *exhaustively* exact correlation designated by the irrational number "φ", observed (the speech is about the incompleteness and unattainability) in the investigation of the character of the change of the values of the relations of the neighboring members of the increasing Fibonacci sequence.

The golden proportion, or the special correlation of the whole and the part designated by the number "φ", is an indicator of *the heightened contentfulness* of forms-relations of a definite type, manifesting itself through the optimality of properties-characteristics and through the aesthetic perfection of these forms. The irrationality of this number testifies both to the unattainability of the *exhaustive* expression *of the highest contentfulness* by the forms of such proportions, and to the possibility of the unlimited approximation to its exhaustive expression. The coming *of the event of the exhaustive expressedness* of the highest contentfulness by the form of the golden relation would mean that, *beginning with some step* of the realization of the algorithm of the computation of the constant "φ", the correlation of the whole and the part (of the golden proportion) would remain *unchanged*, i.e., limited by some quantity of signs (*by any* their quantity, but necessarily *limited*), and therefore *unchanged*. However, the infinity and non-periodicity of the fractional part (i.e., the irrationality) of the number displaying this correlation (as in the case with the number "π") speaks of the opposite.

As in the case with the number "π", the infinity and non-periodicity of the fractional part (the irrationality) of the number "φ" means that very *barrier* which separates two sides-constituents of one and the same relation {content/form} that are *incompatible* in exactness and non-interchangeable. As in the case with the same "π", again we note the infinite "run-up" or the unending transition from one component of reality to the other (from one region of reality — into the other) in their relation. If the case with the number "π" speaks of the impossibility of the whole expression of the boundless continuity and curvature by the limited discreteness and rectilinearity, then the case with the number "φ" testifies *to the principled inexpressibility in an exhaustive manner* of the contentful whole (again uncountable and continuous) by means of the totality of formally limited parts (i.e., by means of the countable and discrete). Despite the inseparability and interconnectedness of the contentful and formal sides-constituents in the known relations "π" and "φ", *the barrier* between the contentful and formal components (in both relations) is essential to such a degree that it cannot be overcome by any *successive* or *gradually-measured steps-approximations*, however long these steps-approximations might be carried out. Even human thinking with its enormous potential is not capable of overcoming this barrier *by measured gradualness*; it is overcome exclusively *by a leap*. However, the latter always conceals in itself something not fully understood and not fully said. Partly for this very reason the nature and meaning of the fundamental world constants up to now nobody can properly explain.

Thus, the number "φ" is such a special quantitative correlation between the components in the relation-form {whole/part} which answers to the *maximally possible contentful filling* (or *the highest contentfulness*) of this form-relation.

At that, the irrationality of the number "φ" testifies to the *principled* impossibility of the establishment *in exhaustive* form of the final numerical correlation between the components of the relation-form {whole/part}, corresponding to its maximally contentful filling, and thereby to *the impossibility* of the acquisition of *the highest contentfulness* by this form-relation.

The impossibility of the exhaustive expression of the highest contentfulness by the indicated form-relation is ascertained in the course of the modeling of the process of the acquisition (achievement) of this *highest contentfulness* by the procedure of the computation of the correlations of the neighboring members of the infinitely-increasing Fibonacci sequence.

Undoubtedly, the number "φ", fixing a definite correlation of the components (sides-constituents) in certain concrete forms-relations, is connected with a certain *optimality* of these concrete forms-relations, conditioned by such a remarkable-kind correlation of components realized in them. At that, one

cannot but see that *the internal contentful fullness* of these forms is primary, while the optimality and the remaining external qualities-characteristics of such forms are derivative and secondary; in practice, however, everything is just the opposite — the formal side is taken for the initial one, and only then through it do they attempt to express *the rationality* and *irrationality* of all internal connections and relations.

The heightened internal contentfulness of forms-relations, marked by the golden correlation of their components, sets *the most optimal intensity of the development* of such forms, ensuring their prolonged and productive contentful existence at certain stages. However, a similar scenario can be true and realizable only at definite segments of the development of these or those forms; with the change of conditions and circumstances (i.e., in the course of the inevitable further universal development) these or those bearers of golden proportions may lose their miraculous potential. For this reason it is very imprudent to be carried away *by the excessive absolutization* of the special correlations of components and of the forms-relations corresponding to them, predicting for such forms the main roles for all times. Real forms are different and all sorts, and therefore the entire spectrum of developing forms-relations is by no means exhausted by one (this or that) concrete correlation of their components. At the given stage of development precisely such a correlation of the constituent sides within certain forms-relations is and looks most optimal, stable, and expedient; at another stage under other conditions and circumstances this correlation may be forcedly transformed (just as over the centuries change the sympathies toward the proportions and beauty, say, of the female figure). Therefore to attempt to reduce all forms-relations to the golden relation, i.e., to absolutize, fetishize, mystify this relation and to spread the known myth (about the through presence of this correlation) wholesale over the entire host of unique developing forms — is absurd. Moreover, in the indicated connection the main task of man and of his thinking is *to learn to foresee and anticipate* the appearance of new correlations (including *optimal* ones, i.e., distinguished *by heightened contentfulness*) of the contentful and formal sides-constituents in their relations-forms *at new stages of development*, ***which***, in fact, will determine the further progress of mankind.

In general, all manner of assertions about the "final" discovery of the most final and perfect of forms (be it the golden section, or some "universal" mathematical formula, or some "super" technologies) contradict the very spirit of development, which, despite any "absolutes," *breaks open and overcomes* by its contentful side any form attempting once and for all to fix in itself and by itself any contentful movement-development; from definiteness => through indefiniteness => to new definiteness, — such is the most general form of the chain of the accomplished development. At that, the elements of indefiniteness and unpredictability of the course of development were, are, and will always be — in accordance with the formulation of *the principle of self-development* (the return to oneself, but every time to oneself changed, enriched, and developed). This context

presupposes as natural the representation of the fact that *the moment of indefiniteness* is also an objective and inalienable element of every development.

Examples of the description of the *optimal* kind of all sorts of forms and processes, the construction, formation, or development of which submits to the regularities of the golden proportion, can be found in such printed works: [2, 14, 15, 19, 25, 40, 50].

§ 3. With the examination of the essence of the number "e" the matter stands still more complicated

In the scientific and educational literature the constant e is identified as the base of natural logarithms, which by no means introduces any additional clarity in our case. The constant e is not connected in an obvious way with simple geometric relations like the constants **π** (pi) and **φ** (phi) examined above. If the number **π** serves for the most part for the description of quite static forms-relations, the number **φ** — for the description of transitional forms *ready* for dynamic development, then the number **e** is present in the description of the most dynamic, in the fullest sense of the word, developing forms-relations-processes-systems, the components of which prove to be, first of all, such sides-constituents of reality as: {motion/rest}, {time/space}, {energy/mass}, {kinetic energy/potential energy}, {temperature/pressure}, etc.

As the authors of modern publications consider: "If π is responsible for space, then **e** — for time and likewise manifests itself almost everywhere" [20]. In other words, **e** *is responsible* not for statics, but for dynamics, for the process, for changing and progressing forms (and not for forms for the most part object-like and static).

Proceeding from this, one should expect that the interconnection and correlation of the components in their relation, designated by the number **e**, are more complicated and more contentful than in the relations of **π** and **φ**, since with respect to the constant e the speech goes about components of another "floor" of reality, of another level of contentfulness, than those levels which are occupied by the components of the relations of **π** and **φ**. Correspondingly to this, the numerical value of **e** fixes *another*, than **π** and **φ**, "boundary" and transitional correlation between the mentioned components in their relations.

Besides, from the position of our representations about the development of reality (i.e., from the position of *the concept of development*) the above-enumerated set of relations ({motion/rest}, {time/space}, {energy/mass}, {kinetic energy/potential energy}) enters into the "clip" or "sphere of influence" of such a generalized relation as **{change/basis}**. On this foundation, further investigations of the essence of the constant e we shall

conduct in the context of precisely this, most informative for us, initial relation.

The relation {change/basis} — this is a completely different "class," a different level of forms-relations, than the relations {curvature/rectilinearity} and {whole/part} examined by us earlier (in the consideration of the constants **π** and **φ**). The form-relation {change/basis} differs from the two latter forms-relations by a more expressed dynamism, mobility, liveliness, changeability.

But all this, as before, clarifies little; for a magic carpet by description may be both square and Persian, and take part in air parades, but the main thing (in the channel of our mood for the revelation of the inconspicuous essence) would still be the elucidation of that — **what** makes it a carpet-plane.

Therefore, again, as in the cases with the numbers **π** and **φ**, let us turn to the most capacious definitions and interpretations of the constant e, as well as to the history of its appearance and origin.

The initial and most effective, in our opinion, push or key to the comprehension of the sense of the number e is provided by its *classical definition* [8, p. 231; 26, p. 354]. Scrupulously examining this definition of the number e from the position of *the concept of development* mentioned already more than once, one can discover that under the very definition of the given number there hides a peculiar algorithm of the realization of the *most effective* way of the accumulation and assimilation of the accreting content by some form developing in the direction of the acquisition of *the highest* (maximally attainable) *contentfulness*! And again the speech goes about a certain *contentfulness*, which likewise served for us as a key moment in the course of the revelation of the essence of the constants **π** and **φ**. The form realizing itself by such an algorithm represents an *optimal* formation thanks to the way, following from the given definition, *of the appropriation of the maximally possible volume of content accreting on the basis of a very limited initial contentful volume of the form itself and over a quite definite finite interval of time*.

On what is this assertion based? On the comparison of the textbook *definition* of the constant **e** with the way of the calculation of the compound bank interest accrued on a certain sum of the initial money deposit in the course of a definite time interval [31]. Strictly speaking, the history of the origin of the number **e**, as is noted in many literary sources, is connected precisely with the seeking-out of the maximal limit of the growth of the money deposit accreting with respect to its initial sum under the conditions of infinitely shortening intervals of time between the moments of the accrual of interest on the successively accreting at those same moments sum of this deposit. Only, in contrast to the history with the origin of the number **e**, in the case of the investigation of *the definition* of this number *from the position* of the mentioned *concept of development* under the sum of the deposit and the

bank interest there are implied a certain form of the initial content (basis) and a certain abstract content "winding" onto the basis (change), accreting to the basis by the algorithm corresponding to the above-mentioned way of the accrual of the bank interest.

According to the algorithm used for the calculation of e, providing for ever more frequent (accelerating) interest accruals on the correspondingly accreting sum of the deposit, with such an increasing frequency accretes also the very sum of the deposit; a similar algorithm is realized, as we have already established, also in the computation of the ever more exact value of the constant **φ** by means of the infinite sequence of Fibonacci numbers. Only in contrast to the forms, the static proportions of which are determined by the measures of the number **φ**, the forms formed after the patterns of the number **e** are built by the dynamic path, with the participation of the *step-by-step* changing component of time, by virtue of which also in this latter case the accumulating content does not succeed in being expressed by a form *wholly*, — the state of contentful "saturation" is not attained (does not set in) *in principle*, since there is always, there is always present a "beyond-form" leakage of content, despite the process of the successive growth, perfection, and raising of the degree of the "all-embracingness" of the form of the representation of this content. Hence, even in the regime of the rapidly developing dynamic layering of content (change), predetermined (the speech is about the regime) by the indicated algorithm of the computation of the number **e**, and even with the limited content of the isolated initial form (basis), it is impossible in *the limit* (fully and without remainder) to cover, absorb, and appropriate *exhaustively* all the accreting content by any final form whatsoever! Here we again (as in the case with the number **φ**) encounter the *principally* unattainable *limit* of the accumulation and expression by any *perfect* form whatsoever of ***exhaustively*** all the unswervingly accreting (in the course of the development of this form) content.

It must be said that mathematicians, describing **e** as a remarkable limit of a certain functional relation, do not connect the algorithm or procedure of the computation of the value of this relation with any of the physical processes [2]; in other words, for the mathematical cast of mind the examination and solution of the task in the most general abstract formulation is a natural and habitual matter.

In the case examined by us of the use of the algorithm of the computation of the number **e** for the calculation of contentful accumulations (changes) proceeding from the initial limited contentful volume (basis), the "denominator" (i.e., the basis) of the relation {change/basis} adduced earlier, like the "numerator" (change), directly participates in the contentful accretions and accumulations: changes do not occur on an empty place, but always "cling" to the basis (to the initial deposit, to some starting capital or contribution), and this concerns not only the development of specific forms-

relations in the domain of economics and finance, but also the development of any forms whatsoever and in any spheres whatsoever.

A similar point of view on the correlation (interconnection) of the indicated components in the mentioned relation is considered self-evident (can one really separate the change itself in its "pure" form from that ***which*** changes?), — see, for example, about the connection of change and the stability of the properties, structure, and laws of the existence of bodies [44, p. 161]. Since the numerator of the relation ("change") is not essential by itself (outside the "basis"), then under the "change" of the numerator one should understand the "contentfully changing basis" (or the "basis accreting with content"). Under the "basis" of the denominator there is understood the "basis of the initial content." So, the analysis of the given algorithm shows that the maximal sum of the increment of the content of the changing basis, i.e., of the "numerator" of the relation, in comparison with the content of the initial basis, i.e., with the "denominator" of the relation, under the conditions of the realization of such a special algorithm (specific way of the increment of content) cannot go out beyond the limits of the excess of the contentful primary basis in **e** (as a certain definite number) times.

Let us now examine, in what the specific algorithm of the calculation of the compound bank interest (i.e., of *contentful* accretions and accumulations in the context of our *concept of development*), coinciding in form with the algorithm of the computation of the constant **e**, differs from the other algorithms of bank accruals.

According to the mechanism of the realization of the given algorithm, **the maximal increment by content of a certain form of limited initial contentful volume in the course of a finite interval of time is attained under the condition that every infinitely small part of the contentful volume of the given form ensures an increment, externally accreting to this part of the contentful volume, proportional to the sum of the initial contentful volume of this part and of the contentful volume accreting to it in the course of periodically repeated contentful additions throughout the mentioned interval of time**. By this somewhat ornate phrase here there is merely *verbally* transmitted the essence of the well-known mathematical expression for the computation of the constant e [8, p. 231; 26, p. 354], — *and nothing more!* In other words, thanks to such a way of accumulation (contentful enrichment), every particle, every smallest (infinitely small) element (at first of the initial, and then of the "layer-by-layer" accreting form) participates in full measure in the general single process of the accumulation and assimilation (assimilation) of the externally arriving content. And even under such a condition, the total volume of the content of the initial form (i.e., of the basis) and of the content externally arriving or accreting to the content of the initial form (i.e., of the change) is not capable of exceeding the contentful volume of the initial form (basis) more than in **e** times.

Thus, the number **e** is located on the boundary of the demarcation of the two components in the relation {change/basis} and binds them together by a definite dependence, conditioning the change (accumulation) of the content accreting to the basis (i.e., "sticking" or "winding" onto the initial, deliberately limited volume of the basis) in the total calculation, not exceeding the volume of the primary basis more than in **e** times.

As it can now be seen, the algorithm of the calculation of e resembles the formulation of *the principle of self-development*. And in the one, and in the other cases there is present the dynamics of the development of the form in time and space. The difference consists only in the fact that the first variant describes *the particular case* of the development of a form of initially *limited* contentful volume (initial capital, a definite sum of a money deposit in a bank, some process in an isolated spatial volume, etc.) throughout a concrete *finite time interval*; the second, generalized variant is applicable to the description of the development of any forms (including open developing systems, as well as the totalities of systems as a whole) without any space-time limitations.

The conditions of the realization of such a special algorithm (answering to the above-noted particular case) presuppose the presence of explicit limitations both of the contentful and of the formal plan; there is evident the limitedness both in time of the accrual of the interest, and in the volume of the initial deposit (i.e., limitations of the space-time character). But along with this, all the advantages of such an isolated process are likewise demonstrated in full force.

Being *a particular case* of *the general principle of self-development*, the algorithm of the calculation of the number **e** (similar in form to the process of the "winding" of content described by the formulation of *the principle of self-development*) allows separate forms under the specific conditions of *the activity* of their *limited* contentful primary basis in the course of finite time to accumulate the maximally possible content by virtue of the circumstance that ***every small particle, every smallest element of these separate forms participates in a direct and full-valued way in the process of contentful accumulation***.

Thus, the number **e**, or more precisely the algorithm of its obtaining (computation, calculation), represents a description of the most optimal way (procedure) of the assimilation and accumulation by some concrete separate (isolated) form of the maximal volume of the content arriving from outside.

If in the cross-section of what has been said one imagines that the developing reality (i.e., the entire world surrounding us) as the universal form of a single complex process (not having limitations neither of the formal, nor of the contentful character, i.e., not limited neither in space, nor in time) were composed ("woven") of such maximally effective (optimal) *small* "**e**-forms," then this single universal *big* complex form would be

characterized by *the highest contentfulness*. However, the "harsh" reality introduces its corrections in the form of *the interference* and *interpenetration* of forms into the "fates" of one another. The "atypicalness" of such "**e**-forms" is conditioned by the circumstance that the given form is built on the basis of an initial form, contentfully limited and quite isolated from the interaction with other forms; a similar algorithm of development is not viable in application to the incomparably more widespread open forms-processes, which, by virtue of the *forced* interaction with other forms, develop by more general and less optimal patterns. Meanwhile, the "**e**-form" — this is a vivid example of the most optimal and effective development of a form within the framework of content-form limitations (i.e., limitations, in this case, of the space-time character).

Because of the described limitations, a similar specific algorithm (after the type of the calculation of the number **e**) is not realizable *in full measure* with respect to the open forms-systems, having universal distribution and developing by the general patterns of the generalized formulation of the universal *principle of self-development*. The capitalization of a limited bank deposit or starting capital — this is almost the only specimens of really existing more or less closed isolated systems, to the description of the development of which the algorithm of the computation of the number e is ideally applicable: probably, for this very reason all literary sources, as if on command, refer exclusively to the example of the calculation (sanctified by the name of Bernoulli) of the compound usurious interest, — as to the example of a really functioning isolated system, guaranteeing the maximally attainable contentful accumulations under the conditions of known limitations.

However, this by no means signifies that the advantages of such special forms are in any noticeable degree not realized in practice; the fact that the specific "**e**-forms" by urgent necessity are widely used by man in the form of dimensionless values in the description of a huge number of all sorts of real processes signifies that the real forms are oriented toward development after the image and likeness of the most contentful "**e**-forms," but by virtue of the merciless *external influence*, *interference*, and *interpenetration* on the part of the same forms the trajectory of their development can be substantially distorted and significantly differ from the most optimal one. In other words, the designation of the number **e** (preserving in the "folded" form the algorithm of the obtaining of this number), being present in various combinations with other parameters, variables, and arguments in formulaic expressions describing all sorts of real processes, indicates thereby although far from the highest, but still some *optimality* (*heightened contentfulness*) of the forms of such processes. Besides, the need for "**e**-forms" in the description of complex forms-processes is conditioned also by the circumstance that by these *small* forms there are "patched" *the ruptures* or *steps* on the boundaries of the division between the sides-constituents of reality, objectively taking place under the conditions of the development of big forms and processes; *compromise small* forms in similar cases are simply

necessary for the *adequate* and *correct* description of such really developing *big* processes and forms.

Every form-relation-process has as the direction of its development the *optimization* of itself (which, strictly speaking, constitutes also the essence of the formulation of *the principle of self-development*). By this same circumstance there is conditioned also the presence-presence of *optimizing* values ("**e**-forms") in the formulaic expressions-descriptions of diverse real complex forms-relations-processes. As it follows from our investigation, the most effectively the task of the above-mentioned *optimization* is solved nevertheless by the "**e**-form," which, not having by virtue of the limitations accompanying it any noticeable distribution in the "pure" form, enters, however, as a component part and is extremely in demand in the description of *optimally* developing real general forms and processes.

Along with this, the limitedness by the number-limit **e** — not the only remarkable feature of the scenario of the development of forms in the channel of the algorithm investigated by us. The second remarkable peculiarity of the given scenario — the *principled* unattainability of the limit of the highest (maximal) contentfulness and the inexpressibility of this limit in an *exhaustively* exact digital form. The process proceeding by such an algorithm has neither a platform, nor a point of "saturation." And again we encounter the relation of two components, whose transition from one to the other within the framework of the relation is impossible *by a smooth measured course*. In the role of the interacting and opposing components, as has already been noted, in this case there act the sides-constituents "change" and "basis." The relation composed of these components of reality (analogously to other, more concrete relations of the given type: {motion/rest}, {time/space}, {energy/mass}, {temperature/pressure}, etc.) is doomed to the presence (between the sides-components of this relation) of *a barrier* in the image of an irrational number, answering to a certain objective, although not expressible *exhaustively*, limit correlation of these components. And, finally, the third remarkable feature of the same scenario consists in the possibility of its infinite development and approximation to the expression of the highest contentfulness of the mentioned relation arbitrarily closely.

Neither practically, nor theoretically is it possible to establish exhaustively exactly the correlation, and consequently, also the boundary of the division between the accreting contentful volume ("change") and the initial contentful volume ("basis"); in an analogous way it is impossible to determine also the exact boundary of the division between the components in the "kindred" relations from the same "clip": {motion/rest}, {time/space}, {energy/mass}... With whatever frequency and however long one may attempt to realize similar steps of approximations in the course of the realization of the algorithm analyzed by us, there will always remain some contentful part, not expressed, not calculated, and not subject to calculation by any *rational* form. And this *barrier* between the expressed content and the

content incapable of being expressed in all its fullness by any form whatsoever — is *insurmountable in principle*!
In this very thing consists the sense of the irrational number **e**. The infinite non-periodic fraction of this number personifies that same infinite "run-up" before the "jump" from one domain of reality (*from the rational reality of the form*) — into its other domain (*to the irrational reality of the content*), i.e., from one (*rational*) component of the relation — to the other (*irrational*) component of this same relation.

Thus, the number **e** is such a special quantitative correlation between the components in the relation-form {change/basis}, which answers *to the limit-possible contentful filling* (or *the highest contentfulness*) of this form-relation.

At that, the irrationality of the number **e** testifies to the *principled* impossibility of the establishment in an *exhaustive* form of the final numerical correlation between the components of the relation-form {change/basis}, corresponding to its maximally contentful filling, and thereby to the impossibility of the acquisition of *the highest contentfulness* by this form-relation.

The impossibility of the exhaustive expression of the highest contentfulness by the indicated form-relation is ascertained in the course of the modeling of the process of the acquisition (attainment) of this *highest contentfulness* by the specific procedure of the accrual of the compound bank interest with the unlimited shortening of the intervals of time between the moments of its accrual.

As the experience of observations shows, in the descriptions of optimally proceeding real complex processes (with the maximal for definite conditions contentful increment) there are always present "**e**-forms," indicating thereby the belonging of the forms of these general complex processes to the number of *optimal* forms. On this score in the scientific literature there are presented numerous examples of the descriptions of the forms of the most contentful development of all sorts of processes in the most diverse domains of reality [9, 10, 11, 12, 17, 20, 29, 30, 31, 33, 36, 38, 41, 43, 46, 49, 55].

§ 4. Having determined ourselves with the nature, meaning, and necessity of the introduction by man of the world constants into practical circulation, let us make yet several more clarifications and explanations

As it has been possible to establish in the course of the investigation, all three constants examined by us — **π**, **φ**, and **e** — are limits, toward which functions-relations of a certain kind strive with the unlimited increase of their arguments. The historical excursus allows revealing the circle of particular practical tasks, in the course of the solution of which the first mentions of the above-named values appeared. The solutions of the indicated tasks are

connected with the finding of the algorithms of the computation of the following limits:

- in the case of the constant **π** — of the limit of the relation of the increasing perimeters of the polygons inscribed in the circumference (or circumscribed around it) to the diameter of this circumference [42, p. 43];
- in the case of the constant **φ** — of the limit of the relation of the increasing total whole to its parts on the basis of the modeling of the computational procedure by means of the ascending sequence of Fibonacci numbers [39];
- in the case of the constant **e** — of the limit of the relation of the content accreting in a definite way (up to "saturation") onto the content of the initial form (i.e., of the "numerator") to the content of the initial form (i.e., to the "denominator") on the basis of the modeling of the procedure of the computation of the compound bank (or usurious) interest [31].

The further analysis gives the possibility to discern the relations of the general sides-components of reality hiding behind the relations of the particular sides of the practical tasks:

- in the case of the constant **π** such sides of reality are the components of the relation **{curvature/rectilinearity}**, as well as the components of a series of other "kindred" relations: {continuity/discreteness}, {boundlessness/limitedness}, etc.;
- in the case of the constant **φ** — the components of the relation **{whole/part}**, as well as the components of a series of other similar relations: {general/singular}, {function/structure}, and the like;
- in the case of the constant **e** — the components of the relation **{change/basis}**, as well as the components of a series of other similar relations: {motion/rest}, {energy/mass}, {time/space}, etc.

A scrupulous study helps to understand that behind the above-indicated constants there hide ways or devices of the expression and representation of the objective, but not quite comprehensible for man (*irrational*) sides of reality through the no less objective and considerably more comprehensible for man (*rational*) sides of it. In this sense the constants examined by us prove to be for human consciousness peculiar "transitions" or "bridges" from the domains of *the rational* — into the domains of *the irrational*:

- in the case of the constant **π** — this is the transition from "rectilinearity" to "curvature";
- in the case of the constant **φ** — this is the transition from the "part" to the "whole";
- in the case of the constant **e** — this is the transition from the "basis" to the "change."

The above-mentioned limits are precisely the personification of the barriers, which must be overcome in order to "get over" from one domain of the relation into its other domain, from one component of reality to its other component. The infinite non-periodic string of digits of the fractional parts of the irrational numbers **π**, **e**, **φ** (and they are known today already with

billions of significant digits after the decimal point [2]) looks like an unending "run-up" before the "jump" from one domain of reality into another and simultaneously indicates the impossibility and unrealizability of the *smooth* overcoming of this barrier — the latter is overcome only *by a leap* in thinking, i.e., at the level of *the notions* and *representations* about the interacting contradictory sides-components of reality in their relations.

Being expressed by irrational numbers, the given constants symbolize not simply transitions from one component of reality to another in their actual relations, but transitions *infinite*, *uncompleted*, *unfinished*, *unclosed*...
Precisely this circumstance allows making one of the most important conclusions: if **π**, **φ**, **e** and can be called numbers in reliance on the established terminology with respect to the definition of an irrational number, then "constants" one cannot call them in any way!
The symbols **π**, **φ**, **e** designate "*living*," *uncompleted transitional processes*, by which, strictly speaking, is caused the use in formulaic expressions and descriptions of any and all real forms and processes precisely of *symbols*, and not of concrete numbers.
These are special forms of the expression of *specific* transitional contentful processes, which it would be proper to name precisely so: "**π**-transition," "**φ**-transition," "**e**-transition" or "**π**-form," "**φ**-form," "**e**-form," — proceeding from the corresponding understanding and handling of them as of the designations *of actual transitional forms and processes*.
The mathematical form of the expression of such *limit transitions is* the function. In the great multitude of descriptions of other all-possible forms-processes (i.e., in the diverse formulaic expressions) these functions are present not as constants, but as forms of processes, ***in principle*** not having the possibility of being expressed by constant finite values; in the final analysis **π**, **φ**, and **e** — these are infinite and unrealizable to the end transitions *from the rational to the irrational*, clothed in mathematical form. As soon as and when these transitions are reduced to numbers *with a limited* quantity of significant digits after the decimal point, only then do they cease to be both processes, and transitions, and functions inside the descriptions of more complex and composite processes; only then do these forms turn into constants, the presence of which instead of the corresponding symbols limits *the contentful potential* (fullness and depth) of the mentioned descriptions.

Thus, under the designations **π**, **φ**, and **e** there are implied "folded" algorithms (modeling *the actual transitional processes*) of the computation of the *limit* numerical values of the correlations of the components in the relations {curvature/rectilinearity}, {whole/part}, {change/basis} respectively.

Besides, in the course of the examination it was ascertained that all the irrational numbers **π**, **φ**, **e** examined above designate limits or limit correlations of the components in their relations, answering to *the highest contentfulness* of the relations of these components. If one imagines that the

mentioned relations {curvature/rectilinearity}, {whole/part}, {change/basis} can be characterized by all-possible values of the correlations of their components in the ranges (determining the measure of the contentfulness of these correlations) from the conditional "zero" (i.e., of small contentfulness) up to some highest contentfulness, then the limit numerical values of the "round **π**," the "golden **φ**," the "saturated **e**" will correspond precisely to the maximal contentfulness of the above-enumerated relations (which, as has been noted more than once, in itself is likewise *in principle* unattainable and representable only in the form of an unattainable limit).

Observations and practical experience show that by no means all forms-relations (objects, processes, phenomena) belong to the number of the "round," "golden," or "saturated." The overwhelming majority of the real "ordinary" forms-processes-relations occupies the most diverse steps of contentfulness within the limits of the ranges indicated above; true, all these "ordinary" forms-relations-processes likewise have as the directionality of their development the attainment of all the same *heightened* (and in the limit expression — *the highest*) contentfulness. But the main thing in this connection is nevertheless that among the boundless diversity of forms-relations man has managed to single out such which are characterized *by heightened contentfulness*, which is precisely what distinguishes these forms-relations from all the rest; at that, to the singled-out forms-relations it has been possible to put into correspondence the limit correlations of the components of these relations established by man in the form of more or less concrete numbers, which subsequently became the indicators of *the heightened contentfulness* of the given forms-relations. The singling-out and advancement of such forms from all the rest was and is accompanied by a burst of human emotions (admiration, tenderness, and delight), which in reality prove to be a reaction by no means to *the internal heightened contentfulness* of these forms in comparison with others, but to their *external signs, characteristics, and properties*. And the matter here, perhaps, is not even in the values and magnitudes of the numbers **π**, **φ**, and **e** themselves, but in the fact that such *special* numbers *exist* and they correspond to *special* (standing out from the rest) relations-forms of the development of reality.

As has already been noted, the symbols **π**, **φ**, **e** designate the "boundary" correlations of the components in the most contentful *specific* forms-relations-processes. But these are a kind of *particular* cases among the multitude of other more *general* forms, the development of which is described by the generalized algorithm (formulation) of *the principle of self-development*. Therefore the presence of the symbols **π**, **φ**, **e** in the description of other more general complex processes and forms indicates *the optimality* and *heightened effectiveness* of these other complex forms and processes in comparison with the configurations of all the other real processes and forms. Besides, in the presence of objectively taking place *ruptures* or *steps* between the sides of reality at the boundaries of their division, in a series of cases the *adequate* description of really developing

forms and processes without the attraction of the "**π**-," "**φ**-," and "**e**-forms" is simply impossible.

The following assertion will be the answer to the question posed at the beginning of the article: all three algorithms for the calculation of the limit correlations of **π**, **φ**, **e** — these are particular cases of the generalized algorithm (formulation) of *the principle of self-development*, which lies precisely in the basis of the fundamental regularity of development, conditioning the necessity of the seeking-out and practical application of such "constants." In all three cases the speech goes about conditionally "ideal," conditionally "exceptional," limit-contentful forms-relations, in some way isolated (especially in the case of the "**e**-form") from the interaction with all the other real forms. In the "harsh" reality of such exceptional (ideal) forms there are very few, they are — special; the forms of the open real world, however, are the product and consequence of the confrontation and interaction of the whole host of the forms of the open world. And with respect to such a kind of open real forms and processes the speech is conducted already not about their absolute perfection, exceptionality, and ideality (as in the case of the particular specific forms-relations), but about their ***movement-development*** *in the direction of a certain optimality* (i.e., of the maximally attainable contentfulness), but under the conditions of the real *interference* and *intervention* of other forms. And in the same way the sign of the orientation toward optimality and the highest contentfulness, but already in the case of the real complex open processes-forms, is the presence of the small "**π**-," "**φ**-," and "**e**-forms" in the descriptions of these big real open processes-forms.

Thus, **π**, **φ**, and **e** — these are the algorithms of the particular specific forms-relations, characterized by the expressed directionality toward the attainment of the absolute perfection and exceptionality of their special forms, whereas the algorithm (formulation) of *the principle of self-development* determines the universal directionality of the movement-development of any all-possible forms-relations of reality, including also the specific particular forms investigated by us.

Any and every SOMETHING is a relation, accessible to expression with respect to everything else and in mathematical or digital form. The number in the given case acts as the measure of any and every relation; the number is the quantitative characteristic of the relation, indicating the correlation of the components in their integral relation, the degree of the participation of the sides-components of the relation in one another, the degree of the expressiveness of one constituent by means of its other, the position of the boundary of division between the sides-components in their relation. The known examples of the found remarkable limits of **π**, **φ**, and **e** speak of the real and quite realizable possibility of the numerical expression (cognition) of one through the other: of the whole through the part (or through the totality of parts), of the boundless continuity through the limited discreteness, of the developing content (change) through the existing form (basis), of the

uncertainty through the certainty, of the unknown through the known (but every time with some differences from the already known), etc., etc. *Precisely in such a way (by way of the expression of the unknown or of the contentful not "graspable" by consciousness in full measure through the known or cognized form-like) is realized the process of cognition (as, incidentally, also development itself), and another way and other path simply does not exist.* The numbers **π**, **φ**, and **e** — these are examples of the resultative attempts of man to express one (insufficiently cognized) through the other (sufficiently comprehended).

However, besides the load — to be "bridges" between the sides-components of reality — the so-called "constants" examined by us fulfill yet one more important function: all three "constants" — these are boundary pillars (milestones), standing on different frontiers and outlining the boundaries of the objective physical level of reality; the first two (**π** and **φ**) are located on the boundaries of the division of the domains connected with the external, for the most part static geometric (*spatial*) forms, the last one (**e**) — on the boundary of the division of the components of the more abstract, more deep-lying and dynamic (*temporal*) forms-relations.

Further, taking into account that **π**, **φ**, and **e** are located on the boundaries of the components of completely *differently planned* and *differently leveled* (in any case, obviously not intersecting) forms-relations, which are the relations-forms {curvature/rectilinearity}, {whole/part}, and {change/basis}, one must seek the quantitative connection between these forms-relations (and, correspondingly, between the numbers answering to them) with the account of this *differently-leveledness*, i.e., more meaningfully. It is not excluded that with time such an internal connection will be established or there will be discovered a system of numeration (and maybe, also a system of reference), in which the world "constants," like the chemical elements of the Mendeleev table, will in an ordered way occupy definite little cells of the table, thanks to which it will prove possible to forecast the appearance and introduction (dictated by practical necessity) into circulation of new world "constants."

As for the other world "constants," and in particular the so-called physical "constants," then, probably, in a similar way one can investigate and establish the genuine essence both of the speed of light [4, pp. 98–107; 5, p. 37], and of the gravitational constant, and of the Planck constant, etc. At that, it is necessary to remember that every world "constant," still insufficiently comprehended and for the time being passing for an inexplicable and unsolved number, — this is always *a barrier* or at least a "boundary pillar" on the frontier between the incompatible and differing from one another components-constituents of a certain relation, i.e., between the objective sides of reality. Moreover, it is no less important also to understand that ***the mentioned relations of the noncoinciding and opposing sides of reality are not located somewhere there, in the "far distance" from one another, and are not separated between themselves by some***

"spaces" and "times," but are interwoven into one another and are found in a single bundle in every smallest element of reality, occupying its different levels-floors.

The "constants" have an important significance, since they stand on the frontiers between the thoroughly cognized and the insufficiently studied or not yielding to understanding also as easily and freely as the already cognized; precisely the world "constants" outline the boundaries of the *rational* (from the position of the stereotyped human thinking) world, i.e., of the habitual and very "definiteness-like" objective (geometrically-physical) level of reality. If **π** is located on the boundary of the transition from the linear (flat) world to the spherical (filled with curvature), then the number e and a whole series of other world "constants" stands on the threshold of the transformation of again the habitual for us three-dimensional world (absolutizing its static spatial-form side-constituent) into the dynamically changing, so-called space-time continuum. In view of the importance of the relations fixed by the designations of the world "constants," with each of these relations and the correlation of their components one must deal unhurriedly and carefully; offhand such questions cannot be *correctly* resolved. In any case one must begin with the study of the history of the origin of this or that problem form-relation — here at once there may be discovered the main hint for the disclosure of the secret of its special properties and, correspondingly, popularity. The following of the principle of the observance of the unity of the historical and the logical in the conduct of such examinations — is especially topical.

The understanding of the essence of the world "constants" pushes apart the horizons of our representations about the developing reality, since the "constants" are the indispensable participants of the *correct* modeling of the behavior of the most multi-leveled reality, being found in the composition of the mathematical (formulaic) expressions describing this behavior. In this connection it is most expedient, in our opinion, to adhere to that position that with respect to each concrete case the best solution, interpretation, and explanation will be found by the "narrow" professional, who has mastered *the concept of development* presented here and mentioned yet again more than once. Say, the specialist in the domain of the history of the formation of geometry (with the knowledge both of mathematics and of its history, well acquainted moreover with the indicated *concept of development*) will find it easier than anyone else to come out onto the initial conditions and circumstances which led to the empirical or intuitive discovery of the remarkable correlation of **π**; or the physicist (well acquainted with the historical background and again with the given concept) will find it simpler to deal with the number **e**; and the biologist (zoologist, botanist), who has mastered *the concept of development*, — with the regularities of the golden relation in living forms, etc., etc. The world "constants" are waiting for their researchers.

In conclusion let us note that the present article serves as an example of the practical application of *the concept of development as* **an instrument** *for the investigation of the surrounding world*.

Conclusion

Let us sum up what has been set forth.

1. The world "constants" — these are the external forms of the manifestation of the internal connections and relations of the sides-components of reality; these are peculiar "bridges" between the mentioned sides-components in their real relations; these are the limit correlations of the definite sides-constituents of reality, expressed by numerical values.

2. The concrete examples of the remarkable limits of **π**, **φ**, **e** testify to the principled realizability and resultatively realized by man aspirations and attempts of the quantitative expression (let it be even approximate) of the insufficiently cognized (*irrational*) sides-constituents of reality through the comprehensible and habitual (*rational*) sides-constituents of it.

3. The irrationality (i.e., the infinity and non-periodicity of the fractional parts) of the numbers corresponding to the mentioned limits of the relations of **π**, **φ**, and **e** indicates, in the first place, the *principled* unattainability of *the expression* in an ***exhaustive*** form of the *irrational* side-constituent of reality through the *rational* side-constituent of it and, in the second place, the possibility of an arbitrarily close approximation to such an *exhaustive* expression.

4. The same irrationality of the numbers **π**, **φ**, and **e** indicates also the fact that these numbers — by no means "constants," as is customary to consider, but certain forms *of infinite processes of the transition* from one side-component of reality to its other side-component. Perceiving this at the level of intuition, man for that very reason includes them in the formulaic expressions and descriptions of real forms and processes not in the form of concrete numerical values, but in the form of *symbols*.

5. The world "constants" — these are a kind of "boundary markers" along the perimeter of the boundary of the most studied by man, comprehensible for him and habitual objective (physical) level of reality, i.e., precisely the world "constants" *outline the boundaries* of the so-called *rational* (from the position of the everyday human consciousness) world.

6. The limits of the relations of **π**, **φ**, and **e** — these are also "milestones" on the boundaries of the division between the components of quite **differently leveled** relations, such as: {curvature/rectilinearity}, {whole/part}, {change/basis}; for that very reason to seek the quantitative correlations between their numerical values without the meaningful penetration into these relations and their components preceding the given search, in our

opinion, is little effective. It is quite admissible that between the above-enumerated forms-relations there exists a deep-lying contentful (*nonformal*) connection, which may be discovered with time; but in order to speak about this concretely, further in-depth investigations of these very relations and their components are needed.

7. The numerical values of **π**, **φ**, and **e** designate the correlations of the components in the above-enumerated forms-relations, answering to the *heightened* (and in the limit — *the highest*) *contentfulness* of these forms-relations on their levels, which makes these forms-relations the "happy" possessors of their remarkable properties and characteristics, fixed by the human consciousness as something special and exceptional.

8. Since, without resorting to the help of the "constants" investigated by us, many real processes it is simply impossible to describe *correctly* and *adequately*, man attracts these specific forms-relations (**π**, **φ**, and **e**) for participation in the descriptions of many other real complex forms and processes. Being present as the designations *of the processes of transition* in the formulaic expressions and descriptions of other, more complex forms and processes, these specific forms-relations of *heightened contentfulness* indicate thereby *the optimality* of those other forms and processes in comparison with the multitude of other "ordinary" forms and processes, not distinguished by a similar optimality. Besides, under the designations of the "constants" in such descriptions there hide *compromise connections* (bridges), "smoothing" the objectively existing *ruptures* or *steps* between the components of reality.

ARTICLE 3

The Universal Criterion of Truth

Abstract

The cornerstone of the epistemology of any philosophical system or doctrine is the question of truth.

Based on the analysis of the work of Vladimir I. Lenin "Materialism and Empiriocriticism", it is shown that the criterion of truth or of the truthfulness of the forms of developing reality is not practice, erroneously considered as such to this day, but the contentfulness (substantive richness, pithiness) of these forms; practice, in its turn, is a method or procedure of evaluating the fullness or the "quantity" of the contentfulness of the forms of reality. Moreover, practice represents only a particular case of a more developed technology of establishing the truth — interpretation.

The criterion of truth put forward in the present article makes it possible to evaluate quantitatively the significance of the forms of reality, which, in its turn, gives the possibility to rank the forms and, on this basis, to outline more meaningfully the directions of promising investigations.

In the same connection it is noted that there do not exist two or more equally contentful truths (ideas, representations, statements, theories, concepts, models, opinions, points of view, etc.) with respect to one and the same investigated question or subject of judgment, just as there cannot in principle exist two or more equivalent approximations to objective truth (absolute truth). At every given moment of development, the truth in the indicated sense is always one.

In addition, it is shown that the concept of "reflection" ("copy", "mapping") of reality, used by dialectical materialism and other philosophical doctrines for the description of the principle of the functioning of human thinking or consciousness, serves as a limitation or barrier on the path of understanding the essence of the processes of development and cognition of reality; objective reality represents the movement and change of forms in the

direction of the possession of the highest contentfulness (i.e., of the maximally achievable content), and all processes of development and cognition of reality are to be studied and considered through the prism of content-form transitions, conversions, transformations of unitary directionality.

§ 1. Questions of the theory of cognition

In October 1908, Vladimir Ilyich Lenin finished, on the whole, the work on the book "Materialism and Empiriocriticism". A good half of this work is devoted to the critical analysis of the theory of cognition of empiriocriticism (a subjectively idealistic trend in philosophy, fashionable at the beginning of the XX century) and to the exposition of views on the same questions of the theory of cognition from the position of dialectical materialism (for brevity: *diamat*) [11].

Beginning with antiquity and up to the present time, the "central category" of the theory of cognition and the "most important, irreplaceable concept of science" is considered to be the category of truth [4, p. 6].

The ancient dispute of philosophers concerning the cognizability of the world and the truthfulness of the knowledge obtained, extracted, acquired, it would seem, was resolved there, in this Lenin's work, in general outline in favor of the point of view of the Marxists, to whose number the author himself belonged [19, p. 352—353]. And nevertheless, again and again generations of investigators of the surrounding world come, who do not tire of "stepping on the same rake" and continue to fill their own bumps at the price of their own delusions.

Thus, the long-standing philosophical dispute does not subside to this day, and, in all probability, a more complete solution of the same problem, as always, is impossible outside a fresh look at the established state of affairs and without reliance on a worldview requiring periodic refinement.

With regard to the indicated considerations, the present work (article) is called upon:
a) to show that the representations of diamat about truth in the main are nevertheless more correct and stand closer to the truth than the representations of other philosophical systems and doctrines;
b) and then, already on this basis, to develop and supplement somewhat the representations of diamat.

The first question, actual at all times, considered by V.I. Lenin in his book on behalf of dialectical materialism and in connection with the mentioned analysis of the theory of cognition, is the question of the principled cognizability of the surrounding world in the course of the acquisition of knowledge about it.

The second question, following from the first, is the question of the criteria of truthfulness, reliability, authenticity of the forms of the acquired knowledge. The first question is resolved in the work of V.I. Lenin positively by the recognition as real of a series (chain) of objective "contents" or the so-called relative truths, represented by different cognitive forms, as well as by the indication of the movement and change of these forms or relative truths in the course of cognition in the direction of the achievement of absolute truth.

The positive solution of the second question is connected with the reasonable (rational) sufficiency of the criterion of practice (as the criterion of truth), which is "so 'indefinite' as not to allow man's knowledge to turn into an 'absolute', and at the same time so definite as to wage a merciless struggle against all varieties of idealism and agnosticism" [11, p. 138].

§ 2. How diamat answers the questions of the theory of cognition

Let us dwell in more detail on how dialectical materialism answers the questions about the possibility of cognition (i.e., of the cognizability) of the surrounding world and about the evaluation of the truthfulness of the acquired knowledge.

From the position of diamat there exists an external world or object, containing in itself some **objective content**, on the one hand, and a subject cognizing (sensing and realizing) this world, on the other hand. The fact that the diverse forms of the surrounding world (objects, bodies, things, processes, phenomena, etc.) are bearers of a certain objective content, independent of the cognizing subject, raises no doubt from the point of view of diamat, since the results of the millennial practical activity of man testify to this. The question remains — how correctly the representations of the cognizing subject about these forms of the surrounding world correspond to the content of these forms independent of the subject. In the words of V.I. Lenin: "The objects of our representations differ from our representations, the thing in itself differs from the thing for us, for the latter is only a part or one side of the former, just as man himself is only a small particle of the nature reflected in his representations." But if for Kant the "thing in itself" is an "abstraction without reality", then for Feuerbach the "thing in itself" is an "abstraction with reality", i.e., the world existing outside us is quite cognizable and in nothing principally different from the "phenomenon" [11, p. 115].

Further, the presence of objective content in the feelings, sensations, and perceptions (i.e., in the "experience" — according to the terminology widespread at that time [11, p. 123, 327]) of the cognizing subject is sought out and confirmed.

And, finally, the "objective content... of concepts, ideas, judgments, theories, doctrines, and of the integral picture of the world in the dialectics of its development" [19, p. 226] is established, i.e., the presence of objective

content in the abstract forms (products) of human thinking is proved. The fact that objective content must be present and is present in the abstract forms and products of thinking of the cognizing subject is, from the position of diamat, again beyond doubt. The question reduces only to the manner in which this can be confirmed. In other words, in order to establish the truthfulness of the obtained or acquired knowledge (judgments, statements, theories, concepts, formulations of laws and regularities, doctrines, paradigms, models, etc.), it is necessary again to understand — whether the given knowledge (more precisely, its subjectively ideal forms) is likewise a bearer of *objective content*.

§ 3. A review of the existing criteria of the truthfulness of knowledge

The ruler of today's representations about the criteria of the evaluation of the authenticity or reliability of knowledge occupies the range from vulgar-objective objectivism to extremely idealistic subjectivism. Let us enumerate briefly the most known and vivid of these representations [7].

Objectivism considers the phenomena of reality as historically necessary irrespective of the subject of activity and cognition, and therefore truth here is almost identified with objectivity [13, p. 418]. In other words, the speech here goes, as it were, not even about knowledge (a theoretical-abstract form), the truthfulness or reliability of which is necessary to establish, but about representations identical with or "coinciding" with the object itself.

The founders of the already mentioned empirio-criticism considered that the correctness or truthfulness of thinking is conditioned by the principles of the "economy of thinking" (according to E. Mach) and of the "least expenditure of forces" (according to R. Avenarius) [11, p. 165-167]; these same principles they laid also into the foundation of their theory of cognition.

R. Descartes assumed clarity and obviousness as the criterion of truth: if something is understood clearly and obviously, then it is true.

By different thinkers there were proposed as criteria of truth, for example, the internal consistency of thoughts, their value, etc.

Pragmatism puts forward the following criterion: true is that which is useful or advantageous to people.

By the flows of information of modern mass media there is unprecedentedly agitated and imposed on man the justice of the following point of view with respect to the evaluation or choice of the criterion of truth: whoever is stronger (whoever wins) — that one is right. In other words, if one succeeds by force, by pressure, by "impudence", by unexampled insolence, cunning, and rigging to push through and implant into the consciousness of some multitude of people (laymen) any doubtful judgment, statement, conclusions, or inference (and in the limiting case — even a whole system of world-

understanding), then the result of such an action is identified with truth or verity; in many cases it is precisely such a path that is chosen today by different subjects for the assertion of the rightness of their position or point of view.

A number of known philosophers see the criterion of truth in "universal significance". From the point of view of this criterion, truth is that which is "universally significant", i.e., that with which all people agree, or the overwhelming majority of them, or simply the majority.

A variety of this point of view is yet another one, which was adhered to by the French mathematician A. Poincaré. According to the concept put forward by him (this is the so-called conventionalism), scientific concepts and theories do not reflect objective reality, but are the result of an agreement of scientists or arbitrarily established rules. The quintessence of his views is expressed by the following phrase: "The only true objective reality is the internal harmony of the world" [11, p. 161].

Kindred to the views of A. Poincaré there exists also such a point of view: the criterion of truth is beauty (as a manifestation of the internal and external harmony of the world).

It must be said that the variant of appointing as the criterion of truth the "universally significant" (generally accepted, generally obligatory, etc.) is analyzed in detail by V.I. Lenin in this same book of his, where it is shown that in many cases the "universally significant" is a synonym or equivalent of collective human delusions, if this "universally significant" is deprived of *objective content*, given to man in experience, i.e., acquired or established by the empirical path in the course of the cognition of the surrounding world (or, what is the same, in the course of the object-practical activity of man).

§ 4. The subjectivism of the majority of the criteria of truth

It is not difficult to see that the majority of the above-enumerated criteria is, to one degree or another, imbued with the spirit of subjectivism. With all the importance of the signs or indicators of the truthfulness of knowledge contained in them, there is absent the main one, which would emphasize or point to the objectivity of knowledge, i.e., would tie it to the objectivity of the content of the forms of the external world. Certainly, no more or less integral or balanced philosophical system (doctrine) will consider the truthfulness of knowledge outside the connection with objective reality, and in the first place — with that objective world in which such a system abides (whether it "wants" it or not).

Hence grows the need for a complex criterion which would establish and take into account the presence of that very objective content in all abstract and subjective forms of knowledge. To this day, such a more or less balanced system of views is recognized to be the dialectical-materialistic philosophy,

which does not deny the significance of the clarity of thoughts, their consistency, their universal significance, their rationality, economy, obviousness, usefulness, pragmaticality, harmony, etc., etc., but at the same time is fully aware of the fact that the above-enumerated indicators (signs), because of the absence of a sufficiently solid and stable natural connection of theirs with the external world, cannot be recognized as fundamental criteria of truth. Proceeding from such an understanding, dialectical materialism sees as the most suitable sought-for criterion of truth practice or the object-practical activity of man as a subject of cognition.

Thus, under the vaults of the soundly built edifice of dialectical-materialistic philosophy, as its core there is discovered a seemingly quite harmonious system of views on the fundamental questions of the theory of cognition.

§ 5. Peculiarities of the interpretation by diamat of the nature of the subjectively ideal forms of cognition (forms of the representation of knowledge)

And here I would like to draw attention to one peculiarity of the just mentioned system of views. If the subjectively idealistic philosophy turns the sensations of the subject cognizing the external world into a certain "partition, wall separating consciousness from the external world", then contrary to these representations diamat considers that "sensation is indeed the direct connection of consciousness with the external world, is the transformation of the energy of external irritation into **a fact of consciousness**" [11, p. 49].

As we see, according to the views of diamat, in defiance of the views criticized by it of the idealistic (it should be said, both subjectively and objectively idealistic) doctrines, no barrier separating the objective (including the three-dimensional world of objects habitual for us) world, firstly, from the sensual world (sensations, experience) and, secondly, from the ideal world of the cognizing subject, seemingly does not exist. We look further: "These *facts of consciousness* are not merely some conventional signs, symbols, hieroglyphs, but represent **copies**, **images** of real things and processes taking place in nature, and cognition itself is a dialectical process of **the reflection** by consciousness of the objective world" [19, p. 352]. In other words, we see that the level of sensations here is still recognized as the "direct connection of consciousness with the external world". But what about consciousness itself? — and here it is, it has turned into a "fact", and the facts of consciousness represent already certain "copies", "images", "reflections" of real things and natural processes.

According to these representations, the objective content of thinking exists in reality only in the form of a copy, in the form of some reflection of reality. At first, it would seem, one got rid of one "partition" between the forms of objectivity and the forms of thinking, but exactly to the extent of then coming to another "partition" — cognition turns into a dialectical process of

the reflection by consciousness of the objective world. Thereby an involuntary start is given to the process of the "multiplication of entities", with which even a thoroughly religious consciousness cannot agree: willy-nilly there comes to mind the saying of the English monk known under the name of "Occam's razor": "Entities should not be multiplied without necessity." Denying in words the idealistic doctrines with their religious core, in fact we go into religion, for every religion is precisely the earthly embodiment (reflection, copying "in image and likeness") of some unearthly entity.

Marxism, diamat, and indeed any materialism of any worth stand on the positions of the rigid opposition and separation by a "partition" or "wall" of everything objective and empirical (material) from everything ideal, which represents a certain ephemeral "copy" or "reflection" of everything material (read: real). At that, into what category this very "reflection" should be assigned, nobody still knows properly: on "this side" it does not take root in any way (for it is not material), whereas "otherworldliness" is ridiculed and rejected by the materialistic doctrines in the most resolute and merciless manner.

The presence of such an inconsistency (according to the terminology given above — a "partition" or "wall") violates, in our opinion, the harmonious system of representations about the transformation or transfer of objective content from form to form in the process of cognition and leaves no chances for the correct interpretation and correct forecasting of the direction of further transformations of the forms of cognition.

Meanwhile, in the course of the accumulation of knowledge and the improvement of representations about the world surrounding us, the circumstance is realized ever more distinctly and clearly that our environment, just as we ourselves, is a changing, moving, developing multilevel reality, "being made" and "reproducing itself" in the real-time mode and manifesting itself at every moment in a single, unrepeatable, unique copy. In such an aspect, the well-known to us sayings about a certain "copying", "photographing", "mapping" and in the general case — "reflection" of objectively existing reality [11, p. 125] — somehow no longer "get along" very well with the actual state of affairs.

§ 6. Description of the process of the "ascent" of contentfulness by successive forms

But, perhaps, one should not approach the interpretation of the process of cognition, as well as the perception and interpretation of the motion, development, evolution of nature, man, and society, so straightforwardly and "head-on", so mechanistically and trivially?

Why not consider this same process from a somewhat different position or in a somewhat different light, namely: some deep essence or *objective content*

of the developing reality "ascends" and manifests itself in separate successive and mutually conjugated concrete forms — by the conventionally-initial form of thingness (the world of things), further by the form of sensations (the vegetable and animal world, including man) and, finally, by the form of thinking (subjective abstract human thinking).

Being *objective content*, initially represented by the thing form (about any initiality of representation one can speak here very **conditionally**, since about the forms preceding the thing ones, including various physical fields, we cannot yet say anything definite here at all), the mentioned contentfulness in the process of its motion-development changes the form for a more flexible and capacious one, which turns out to be, from the point of view of human consciousness, the form of sensations, which then, in its turn, is replaced by a form still more capacious and embracing, and therefore more abstracted, called by us the form of thinking.

For this reason, each of the indicated forms, as merely *different shells* of the same single, but transforming at the transition from level to level, objective content, must easily conjugate with the forms preceding and following it, which would testify to the succession (and, in the final analysis, to the truthfulness) of all these forms.

The *objective content* independent of the subject (by analogy with the above-mentioned "thing in itself"), present in any and every object of the surrounding world, "ascends" (like the "ascent" of some deep essence of the surrounding world) first into the subjective and abstract contentful forms of the vegetable and animal world (including the form of human experience, to which the sensuous, or sensations, belongs) and then — into the ever more abstract forms of human thinking. In other words, the process "begins" to develop from the moment of the conditional start of the most "coarse", mechanistic-materialistic thing forms, further continues with the forms endowed with sensuousness (to which belong the sensations and reactions of the living — the vegetable and animal world), then is "taken over" by the forms-carriers of the images of consciousness and representations already in combination with the forms-carriers of sensations and the forms-carriers of thingness (higher animals and "early" man) and further continues with the forms-carriers of ever more abstract intellectual-spiritual contentfulness (which are "late", i.e., modern man and society) again in combination with all the preceding forms.

Thanks to the ability to conjugate the separate forms of the single "ascending" objective content, following one after another as continuations of the preceding forms, there arises a generalized (aggregate) multilevel form (of man with his thinking), consisting, like a pyramid, of interconnected and unimaginably interwoven layers-levels-forms, the summit part of which (of the pyramid) is crowned by the form-carrier of an extremely abstract (the most abstracted of those reliably known to us) content (theoretical knowledge).

Having before our eyes the just drawn image of the pyramid, it remains only to make sure that the contents of the mutually linked layers-forms-levels of this pyramid are indeed successive, and, consequently, objective, i.e., represent separate links of the single *objective content* of reality developing in a through manner (by means of the above-indicated forms). The latter, in its turn, is proved with the help of a very well-known procedure, from time immemorial called practice (about which we will speak much and in detail below).

Thus, the "hidden essence" of reality being revealed, or its objective content, "marches" in a through manner in the process of its ascent-development by means of different, growing one out of another and therefore mutually linked forms.

The distinct visibility and confident ascertainment of this circumstance is hindered by the closest interweaving of the forms of the motion of objective content passing one into another. At the same time, one can notice that, being represented by different forms, the fragments of this general objective content differ from one another by some of their peculiarities, which are introduced into them in the course of their development from the initial *objective*, but still to some extent, uncertainty.

So, in accordance with our representations, separate objects (bodies, things, objects) are the forms of existence and "acquiring" of *the objective content* of reality at the level of the inanimate, manifested by means of the forms-levels of the living, i.e., of "sensations" and "thinking".

Further, plants and animals are the forms of the motion of that same objective content at the level and through the levels of the living inanimate, growing out of the forms (and being the continuation of the forms) of the inanimate and, like the preceding thing forms, expressed and manifested by means of the forms-levels of "sensations" and "thinking".

Finally, man with his thinking (mankind and society) is an even more specific form of the motion of again that same *objective content* at the level and through the levels of subjective thinking (consciousness), connected even more closely by direct and feedback connection with the forms of the living and the inanimate and being the immediate continuation of the latter. This form is also expressed and manifested by means of the forms-levels of "sensations" and "thinking".

And since the whole just enumerated set of forms is **the continuation** of the thing form, there is no need at that to introduce some intermediate gaskets in the form of the notions and terms "reflection" or "copy" only in order to emphasize once again the peculiar character of such forms. In other words, the chain of the above-enumerated forms is the same expression, manifestation, motion, "march", development of the objective content, only

in the most *specific*, called subjective, forms, which are **the continuations** of the preceding thing forms. The root of the erroneousness of the representations about such, in particular, a form as the form of thinking (as about some ephemeral formation — the "ideal reflection" of reality), and the problem of the interpretation of such a form lie in the artificial separation of the highest ("thinking") layer from the general single bundle or aggregate of all the levels-forms available in the "human" structure and the subsequent absolutization and opposition of it (of this most *specific* form) to all the preceding forms.

Of course, it is undoubted that the objective contentfulness, which manifests itself and can manifest itself only through subjective forms, will never get rid of the shade of some subjectivity, but at the same time it remains objective by its nature, by its origin, by its roots, which lie in the foundation of the whole chain of forms ensuring the transformation of this objectivity into some specific subjectivity in the course of the motion-development of reality.

The objective content simultaneously ascends through the subject, and moves in this form of its in the direction of the achievement of its "final" expression in this same or another more perfect form, as the most perfect of all the forms. The difference of the forms of the representation of the objective contentfulness in the course of its motion-development is conditioned and characterized by different values or magnitudes of the intensity of the contentful-formal transformations at different levels of the representation and acquiring of these forms. The change of the intensity of the contentful-formal transformations at the transition from level to level in the final analysis turns out to be the main factor determining the development of the forms of reality. [In this work this aspect is practically not considered and not disclosed.]

By every fragment, episode, act of its existence objects (if the speech goes about the inanimate), by every breath and step an animal, by every deed or phrase man extract the hidden **essence** of their nature from inside outward and make it **a phenomenon** (make it **visible**), which (the phenomenon) in fact turns out every time to be only some *next approximation* to the full and all-round expression of this very essence.

The subject with his consciousness does not "reflect" reality, i.e., does not duplicate and does not multiply entities, but **continues by himself** the search for a more contentful form (correcting and supplementing the contentfulnesses of the preceding forms-levels in their aggregate) of the reality developing in such a way. And this new sought-for refined form is realized as a superstructure over the preceding aggregate of forms, absorbing, including into itself in the main features, in a concentrated ("sublated") form the contents of the preceding forms.

From the thing forms — to the subjectively ideal forms (which are simultaneously the constituent parts of the general aggregate of forms,

entering into "engagement" or conjugating with those same thing forms), — this is, in accordance with our representations, the direction of the development of reality at the present stage in the cluster of the forms known to us.

Let us show and analyze the process of the "ascent" and transformation of *the objective content* by the example of a concrete object — a certain spherical boulder-stone, the definiteness of the form, dimensions, and internal structure of which forces one to "reckon" with these peculiarities of its:
— firstly, the inanimate objects surrounding it, running into it under the influence of diverse external forces as into an objectively present obstacle and interacting with it as with an obstacle;
— secondly, the moving living bodies, interacting with it and "taking into account" it already not only as an obstacle, but reproducing or generating in this connection some simplest abstract images of it;
— thirdly, the living animate organisms, which along with the results of the thing interactions with it and the sensuous representations about it, manifest its essence also in the form of developed abstract images and representations, extending from the abstract formula description of its spherical surface to the descriptions of the physical, chemical, and quantum-mechanical properties of its material in the guise of even more abstracted symbolic-formula expressions, mathematical equations, and theoretical computations.

By the example of a spherical boulder (such specimens are also encountered in nature), rounded from all sides by a glacier and subjected to the long-term influence of squall winds, stormy waters, raging fires, as well as of similar stone blocks (by virtue of collisions with the latter), one can trace the "ascent" of the contentful essence of a separate object by means of the forms changing in the course of such an "ascent".

An object of finite, limited dimensions, fixed and imprinted ("perceived") by the neighboring objects as an obstacle, passes with time into the stage of the sensuous perception and the simplest figurative description of it by living organisms as streamlined, hard, solid, massive... and further passes to the stage of the perception of it by human thinking and the description by abstract means in the form of complicated images, symbols, and formulas: as a spherical object of radius R with the surface approximately calculated by the formula $4\pi R^2$; as an object with the volume approximately calculated by the formula $(4/3)\pi R^3$; as an object with the ultimate strength of the material for rupture (or compression), calculated as the ratio of the ultimate admissible load on the object to the area of its cross-section; as an object with hardness determined in conventional units, say, by Brinell; as an object with wear resistance and other properties and characteristics determined by formulas and mathematical dependences known from the courses of mathematics, physics, chemistry, strength of materials... quantum mechanics, etc., etc. And all this complex description can be qualified as the

manifested *contentful essence* of one and the same something, represented by the forms of different degrees of abstractness and subjectivity, — in the course of the ascent of this essence successively through the forms-carriers of thingness, the forms-carriers of sensations and, finally, through the forms-carriers of thinking.

To express the strength and hardness of the material of the boulder through the forms of standards found by the empirical path and established at that, such as the limits of the strength of its material (say, for rupture and shear), and through the empirically established conventional units of hardness (say, by Rockwell, Brinell, or Vickers), — this means to find the expression of new abstract knowledge about the stone (i.e., to find the expression of its *objective content*, developing by new and ever more abstract forms) through the contents of the concrete thing and sensuous forms-standards formed or shaped "in experience". The same concerns the knowledge about the other properties of the stone, such, say, as wear resistance, density, thermal conductivity, electrical conductivity, etc., etc.

Let us now return to the above-cited words of V.I. Lenin regarding the cognition of the world as a process of the sequential transformation of the "thing-in-itself" into the "thing-for-us", and see what emerges if we reinterpret Lenin's words in light of the concept of the "ascent" of the objective content of reality (its deep essence) through forms transforming from objective substantial to subjective abstract ones, which has just been expounded. Then, the initial Lenin quote with our addition will read approximately as follows: "The objects of our representations differ from our representations, the thing-in-itself differs from the thing-for-us, for the latter is only a part or one side of the former, just as man himself..." — is merely a continuation of the content-based development of the "thing-in-itself" into the "thing-for-us" through the aggregate of specific forms manifested by it, which grow sequentially one out of another, such as the form of sensations and the form of thought, which have transformed in the course of the aforementioned content-based development from the form of substantiality.

In the course of the described "ascent" of the content-based component of developing reality — initially through non-living substantial forms, then through living forms of sensations, and further through the intellectual and spiritual forms of human thought — all the aforementioned forms emerge as products of the "demonstration" of the accumulating contentfulness, which products then manifest themselves in the form of successive technologies and ideologies. Reality, as can be seen from our examples, remains the same general, continuous, unified changing substance, but it manifests itself differently at different stages of its movement-development, that is, in different forms: from forms that are concrete and objective (independent of our consciousness, according to the assessment of our own consciousness) — to forms that are increasingly abstract and subjective...

Here it is very important to understand that there is no ready (once and for all) essence of the world, which somewhere "hides" from man and which man has only to cognize in small portions and steps, just as there is no ready (completely exhausting itself and existing independently of anything) objective world: the essence of the world "ascends" by contentful forms sprouting one out of another, thanks to which the objective world is "made" every moment, is recreated and reproduced from itself by the build-up of layer-by-layer changes on the available and simultaneously changing in such a way basis.

The neighboring external object is not simply "reflected" in me (in my consciousness), but **exists** through me by its content, which changes together with me and my consciousness (as **the continuation** of the relation of the components {I/object} or of the more capacious relation {subject/object}) *in the course of the deepening of the knowledge about this object*.

The essence of the changes taking place or occurring in the objective world "ascends" through me and by means of me, in direct connection or *in relation* with me (as well as in relation with another individual, and in relation with an animal, and in relation with an inanimate object). Without me this will be already a somewhat different form of the manifestation of the essence, and with another "I" — this will be a third form of the manifestation of the essence, etc. And only the generalized form as *the aggregate* of the above-enumerated forms exposes, reproduces some generalized collective contentfulness, which only can be called *the objective content*. In other words, about a separate and independent of anyone or anything absolute essence there is nothing to speak here at all — such does not exist in nature. The essence is "extracted outward", i.e., *manifests itself* only in the process of the interaction of something one with something other.

In accordance with such representations about development, the changeability of the forms (from the concrete forms of thingness to the abstract forms of thinking) corresponds to the habitual natural (from the position of human consciousness) course of events. Now, in the light of and on the basis of these representations, one can come to a more exact understanding and conclusion about the actual relation of the components of the subjective and the objective in the process of the described motion of the forms (from the thing ones — to thinking).

Man is a multilevel formation, consisting of a hierarchical sequence (transformed with time into an inseparable aggregate) of conjugating forms-levels characterized by their succession (it is precisely this that, first of all, should catch the eye, but is taken into account by few). The aggregate or bundle of levels, beginning from the atomic and molecular (forming the thing level), further — to the cellular, organ-tissue, and organismic (forming the animal level or the level of the "living inanimate") and further — to the biospheric, subjective, and social (forming the level of the "living animate

and socially organized"), — represents a specimen of the "cohesive" organization of the forms-levels transforming one into another and therefore contentfully successive (including in themselves also even more numerous subforms-sublevels).

On the basis of the adduced reasonings one can come to the following, not unimportant, in our opinion, conclusion: the consciousness of man is not some passive "reflection" of reality, but it is reality itself, the reality itself or, more exactly, the next form of the manifestation of the latter at the next stage of its (of the reality) "ascent", development. At this stage of its motion-development the reality appears before us, as well as before itself, in the specific form of man and his thinking. In this case, consciousness should be accepted not as a dead passive reflection or copy of everything preceding and existing inanimate and living, but as the next form of the manifestation of the contentfulness of the ascending, developing reality, continuing and uniting by itself the whole row of the preceding forms of this same reality.

With such an approach, the living chain of development (and its logic) is not interrupted, growing by ever more capacious, contentful and therefore ever more abstracted links-forms. Such a research approach gets rid of the artificial restriction from above on any development and, in particular, liquidates the known barrier erected by diamat. The succession of the changing forms of reality is not blocked and does not end with the form of man and his thinking, but goes ever more in depth, into an ever more *abstracting reality*... Thereby the process of cognition is also not restricted to the comprehension of the form of thinking as the most "summit" form of the forms of reality reliably known to us so far, but presupposes the presence and appearance of even more developed forms of it with a greater intensity of the contentful-formal transformations (transformations). But, what is more essential, such an approach makes it possible to forecast the further course of development (and, correspondingly, of cognition) and to anticipate with an increasing degree of accuracy the appearance of new forms of the changing reality.

§ 7. A model of reality from the position of our representations. The principle of self-development

But what, at least in the first and the roughest approximation, is this developing reality that serves as the subject of our discussion? Let us try to determine a more or less integral model of it, answering to our views.

Let us imagine some "traveling" two-component, but single integral formation or construction of the kind **{content/form}** — a very abstract one (in its most general configuration), but in the course of its "travel" always appearing in a concrete form, changing in the direction or towards the side of an ever greater and greater predominance in the composition of this construction of the component "content" and the acquisition thereby by the

"numerator" of this relation of an ever greater specific weight within the scales of the integral relation [2, 8, 23].

The changeability of this abstract relation {content/form}, directed in a definite way, is conditioned by the simultaneous unity and non-identity (dissimilarity) of its components, by virtue of which both components are in a state of interaction and inexhaustible motion towards rapprochement with each other and the acquisition of equilibrium (balance) or mutual expressiveness by each other (which means: to become maximally contentful — for the form, and to determine itself with its perfect form — for the content). The presence in one integral relation of two components with different types of activity gives rise to a vortex, a whirlwind, a circulation, a "self-winding" spiral, i.e., a change (motion, development) of a specific character both of both constituents of this relation and of the relation itself as a whole.

"Empirical experience" and abstract thinking make it possible to reveal the deep essence of this motion, clothing it in the formulation of a certain universal **principle of self-development** [2, p. 10; 8, p. 53-54; 23, p. 4]: **the development of content is carried out in the direction of the exhaustive expression by the developing content of the very same developing content**. Applied to the surrounding world, this means approximately the following: *everything that exists and develops has as the direction of its development and existence the expression by itself of the existing and developing itself existing and developing*.

The abstract relation {content/form} with a quite unambiguous directedness of the change-motion-development of the components or constituents of this relation, as well as of the whole relation as a whole, — this is what exists initially, everywhere, objectively and independently of any concreteness whatsoever; this is what, by virtue of its omnipresence, permeates through itself all the available and arising concrete forms-levels-relations. It is precisely the contentful-formal transformations of the above-described directedness (i.e., the changes of the components of the relation in a strictly definite side, in a strictly definite direction) that lie in the foundation of the development of the forms of reality, which are, in their turn, merely the concrete attire and embodiment of the abstract model presented above. And it is precisely this initial model that, by virtue of its solidity, is, in our opinion, the most acceptable and effective for the in-depth study, research, and penetration into the essence of the surrounding world (the changing reality) at the present stage of its development.

The noted *dual-unity* with a very strict and definite directedness of the contentful-formal transformations (transformations) explains the every-moment uniqueness of the world being acquired (the Universe, nature, life, etc.), as well as the uniqueness and diversity of the existing and nascent forms as separate elements of this world.

Being a strictly abstract formation, the indicated relation {content/form} is in principle not manifestable in its most general kind or image, but at the same time constitutes the core or the very essence of any and every real concrete form.

The historical path of the abstract construction {content/form}, likened to the "travel" of it in concrete images, runs through a great multitude of all sorts of concrete forms (including also such kindred to it, but still more concrete forms-relations as {subject/object}, {subjective/objective}, {abstract/concrete}, etc.). It is not the task of the present article to trace the contentful-formal transformations of this relation in the course of its historical motion-development, — and therefore we shall note only that the initial, as, probably, and the final points of its "travel" are lost in the hazy mists of the past and the future, in parallel coexisting in a single bundle or aggregate of concrete forms growing one out of another and transforming in the course of the "travel" under consideration.

Under the "control" of the mentioned *principle of self-development*, internally inherent in all formations-forms and conditioning the existence (on its basis) of all forms without exception, from the form of thingness, accepted by us as the *conditional beginning* of the development of all the other forms of the surrounding world, there developed the next new form of sensations, united with the first form into one whole. This second form differs from the first by a greater intensity of content-form transformations, that is, it ensures feedback, or return to itself, and the "cognition" (reproduction, self-organization) of itself with a greater "velocity" than the substantial form. Under the pressure and control of the same principle, the second form has developed over time into an even more capacious and, accordingly, more abstract form of thought, uniting within itself, as it were, three interrelated forms — the substantial, the sensory, and the cognitive; and this third form is characterized by an even greater intensity of content-form transformations in comparison with the two preceding forms. Thus, all three indicated forms "operate" as if in a single bundle, in a unified aggregate, ensuring an ever more intensive "unwinding" of the processes of development and cognition of the surrounding world under the "control" of the universal *principle of self-development* common to all forms.

Man, who appears primarily as the "carrier" of the form of thought, in fact represents a tight knot of all three forms, characterized by the harmonious unity of these individual forms within their formed aggregate, crowned by the most abstracted, powerful, and capacious form of thought. Man is a "pyramid" of the above-listed interlinked forms of developing reality in the thus "equipped" next "advanced" form of the same developing reality.

Under the "diktat" of the principle of self-development, the content of any form moves beyond its own form in the direction of possessing a form of even greater contentfulness, that is, a form of greater capacity and receptacle for the "accommodation" of this self-developing, "self-making" content. Thus, the process of the content "coiling" onto itself while existing — with the formation of

a hierarchical chain of forms that are ever more content-capacious and, therefore, ever more abstracted — is incessantly carried out.

The very formulation of *the principle of self-development* indicates that the process of cognition is carried out by the expression or replacement of the incomprehensible by the comprehended, of the unknown by the known and well-familiar, i.e., by the circles of self-expression; and such a way of motion (cognition) most exactly fits the interpretation of the term "interpreting" (about which we will speak below). All the constructions of new forms, including the formation of the cognitive forms, go by the expression of the forms through themselves. In essence, the process of cognition, being at first a separate twig standing out on the general trunk of development, closes up in the further course with the latter, turning out to be simply its continuation identical to it.

Since in nature there is no other building material than nature itself or the surrounding world, everything is built and superstructed from itself, by "self-making", — everything "dances from the stove", from the basis, by means of the unceasing self-expression, i.e., the expression of the changing through the existing and the available.

Everywhere, universally, and every moment there functions and is realized the single *principle of self-development*, which conditions the motion of all the forms. The impelling causes, "mechanisms", forces, and motives of any change, motion, development should be considered as manifestations of different intensity of the contentful-formal transformations of the components in the relation {content/form} under the control of the universal *principle of self-development*. In the opinion of F. Engels, "in any field of natural science, even in mechanics, one makes a step forward every time when somewhere one gets rid of the word force" [20, p. 130].

Every change-motion-development is explained by the presence of two unequal, non-identical principles in their single naturally-conditioned **relation**, endowed, on the one hand, with an inexhaustible natural striving for unification and **mutual expressiveness** and, on the other hand, with no less natural incompatibility and opposition. As has already been noted earlier, it is precisely such a dual-unity and confrontation of the two principles in their natural striving for identity, which they never attain, that determines the diversity and uniqueness of the forms of the surrounding world.

The relation {content/form} in combination with the formulation of *the principle of self-development* gives a sufficiently exhaustive representation about the directedness of all the processes, both on the gnoseological and on the ontological levels of reality, and therefore can serve as a naturally-objective foundation for the unification of the sciences that have taken shape over the period of the gnoseological activity of human thinking.

One can speak about some connection between the components in the relations, such, say, as {content/form}, {subjective/objective}, {abstract/concrete}, {man/nature}, etc., only when the presence of one component in the other is established, when these components are mutually penetrated and expressed through each other, when some correlation is established between them. The formulation of the principle of self-development in the most compact form simply "manifests" and "fixes" such a representation about the dynamic interconnection of the components-constituents of reality: the development of anything whatsoever is directed at the absorption, assimilation, and reproduction of itself developing in such a way, as well as at the establishment every time of a new correlation between the investigated components "content" and "form" in their investigated relation {content/form}. As a particular case of development, as its separate branch, human cognition is also oriented at the comprehension of itself cognizing and thus developing.

The objective process of the increase of the contentfulness of the forms on the gnoseological level (as a result of the active "work" of the principle of self-development on the level of thinking) is perceived and evaluated by thinking itself as the increase of the degree of its (of thinking) adequacy, which is equivalent to the perfection of the forms and ways of its representation and existence on this level (in the form) of notions, categories, theories, speculative models, etc.

On the other levels the results of the "work" of the same principle are, correspondingly, different. So, say, on the level of the living inanimate (the vegetable and animal world, including man as an animal) the process of the accumulation of contentfulness is clothed in the following forms: the extraction of nutritive substances from the soil and the surrounding environment (in plants); gathering, search, hunting, and the eating of prey (in animals); the taking of food (in man). The motion and enrichment of the contentfulness by means of the reproduced and changing hereditary (inherited) forms, i.e., by means of the reproduction of offspring, — is also in the row of the contentful development on the vegetable and animal levels. In other words, at the more primitive (from the standpoint of human consciousness) animal and vegetative levels, content-based accumulations are realized, respectively, in more primitive forms — less encompassing and less contentful than at the level of thought. An indicator for assessing the results of the "work" of the same principle at these levels, similar to the indicator of adequacy for the level of thought, is the effectiveness with which an animal or a plant solves the tasks of survival and ensuring its own stable development.

It follows from what has been said in the two preceding paragraphs that there is no insurmountable chasm between the content-based movement at the level of the "living inanimate" and at the level of "thought." This chasm is easily overcome if we regard thought with its forms and modes of existence (in the form of concepts, categories, speculative models, theories, doctrines, teachings, etc.) not as a kind of "ideal reflection" of something material in the human brain,

but as **a continuation** of the realization of the same mechanism, the same algorithm of content-based movement, but in other (specific) forms and at another level — with a bias, a shift towards ever more encompassing, ever more *contentful* forms of developing reality, which the aforementioned conceptual forms are. Thus, the key moment in the awareness of the essence of the transition of the contentful motion from level to level is the understanding or representation **about the change of the forms of the contentful motion** (towards the increase of the degree of the abstraction of the forms), but **without the change of the principle** (mechanism or algorithm) **of this motion**.

Neither nature nor matter is endowed with the "universal property of reflecting", but act only as the forms of the manifestation of the action of the single universal **dynamic** principle of self-development, conditioning the "self-winding" or spiral-cyclic motion of everything existing, which **in statics** is perceived by human thinking as *the reflection of itself in itself* or as *self-reflection*.

It should be noted that the forecast about the emergence and appearance of even more abstracted forms, following the form of thinking, is made here already not on an empty place, but on the basis of and with the account of *the principle of self-development*, conditioning the spiral-cyclic contentful-formal transformations with a bias towards the increment of the contentfulness of the next new forms. It would be the "height of superficiality" not to see that by the form of man and his thinking the contentful motion (or the motion of the contentful constituent of reality) does not end and is not exhausted. How, in what new abstracted forms this motion continues after the contentful-formal "transition" or "leap" from the form of man with his consciousness — is still to be investigated and ascertained. However, with all definiteness one can say that these next prospective forms have no bearing on any eternal paradise or hell under the patronage of a "supreme deity". ***The Absolute is impossible, is unrealizable in principle!*** Every subsequent form partly contains in a concentrated ("sublated") form (and to some extent even "surpasses" by itself) the content of the preceding form, but is by no means final and all-embracing. The contentful motion is inexhaustible and at its next stages appears by means of ever new and ever more contentful (and precisely therefore ever more abstracting) forms.

In this connection let us allow ourselves to adduce a small example-illustration to what has been said. On a clear sunny morning you "walk" your dog on a forest edge. The curious animal will not fail, perhaps, to thrust its paw or nose into a forest anthill, should such turn out to be nearby. As a true lover and guardian of wild nature, or perhaps for some other considerations, you will hasten to drag the dog away from the anthill by the leash. Now put yourself in the place of the ant and imagine that anxiety and horror which take possession of you every time when an incomprehensible something, by

your standards omnipotent, but alien to all your ant essence, suddenly collapses from somewhere "above" onto your measured ant life.

And then one fine day the veil falls from your eyes and it is discovered that this very most horrifying and omnipotent something sits on a short leash at another "deity" — an even more "supreme" and even more "commander-in-chief", which does not let the first "all-holder" and arbiter of ant destinies run wild. For every "master" of the first level there is found its own "master" of the second level, for the chain of the forms of the contentful motion is infinite. It is not excluded that the "master" of the first level in some way "interferes" in your ant life, but it is true, however, also that he is dependent not only on the "masters" of other "supreme" or more summit levels of development, but also on your ant level. And the name of this whole structure of nested (more exactly, conjugated successive) forms and of the process generating it — is the spiral-like "self-winding" content-formal infinity.

Let us hope that this extremely simplified example will at least somehow help to understand the essence of the content-formal motion. If, however, even after such an illustration you do not cease to consider that the omnipotent "deity on a leash" remains for you the most "supreme commander-in-chief", to whom, as before, one must bow in the hope of his patronage and protection, then nothing will be able to prevent you from continuing to abide in peace in the captivity of your sweet dreams and delusions.

[By the way, to seek the traces of the presence of a more highly organized (i.e., gone ahead in its development) level-form, proceeding from the primitive representations about the extraterrestrial "mind" and other forms of "life", is absurd and fruitless. So far, with confidence one can assert only that this next level of the development of reality differs from the forms-levels of our cluster of reality *by a substantial leap in the intensity of the content-formal transformations*. To say something definite about the forms in which reality is acquired at that next level of its existence is still extremely problematic.]

§ 8. The problem of the objectivity and independence of the object from the subject from the position of our representations

The problem of the independence-dependence of the object from the subject in the course of the establishment of the objectivity of the contentfulness in the developing forms of reality was tried to be solved and is being solved by many researchers. Here the following variant of its solution is proposed, or, more exactly, merely *the next approximation* to its "exhaustive" (i.e., "full and final") solution.

The acute moment with which all philosophical currents in one way or another collide is the necessity of the acceptance of one or the other side in the reasonings about the independence or, on the contrary, the

interdependence of the object and the subject. Diamat, as is known, solves this task in favor of the visible and thinkable independence of the object from the subject. From our position, the question about the independence of the object from the subject or of the objective from the subjective in their corresponding relations {subject/object} and {subjective/objective} is akin to the question about the attempt of the separation and isolation of the contentful and formal components in the initial, most general (abstract) relation {contentfulness/form}. Applied to this relation, the sources of the distinction of the indicated components go back into the latent (hidden) **syncretic** unity. The justice of such an assessment and such a conclusion is confirmed by the point of view of G.W.F. Hegel: "In the consideration of the opposition between form and content it is essentially important not to lose sight of the fact that the content is not formless, the form at one and the same time is both contained in the content itself and represents something external to it"; and even more definitely: "The form is the content" [3, p. 298].

Supposing that the relations {subject/object} and {subjective/objective} are merely more concrete manifestations of the abstract relation {content/form}, that high rank of *subjectivity* [5] with which the "numerators" of the first two above-indicated relations are endowed, in our opinion, in no way excludes the deep inseparability and dependence of them on the corresponding "denominators", — except that the noted inseparability and dependence become even more latent and implicit when compared with the unambiguously manifesting interdependence of the components in the relation {content/form}. The latter circumstance (the increasing hiddenness) and serves as the source of the assertions about the independence of the components of the objective and the subjective (of the object and the subject) from each other, categorically and endlessly reproduced (the speech goes about the assertions) by the adherents of this opinion.

Proceeding from our position, it is necessary to state that, exactly the opposite, the visible isolation, autonomy, self-sufficiency, and independence of the components of the objective and the subjective from each other are only relative, since subjectivity (as an active acting principle, as self-sufficiency, as selfhood, as individuality, as competence [15]) is characteristic of the contentful components (i.e., of the "numerators") of all the concrete relations of this type, and this subjectivity or greater activity of one component with respect to the other by no means abolishes their interdependence and deep inseparability, and, consequently, the feedback connection or the influence on each other.

A known example of the demonstration of the presence of that same hidden syncretic inseparability of the components in the relations of this type serves also the ancient paradox concerning the establishment of the primacy of the hen or the egg.

By the way, the activity and the leading principle of the component of content in comparison with the passivity and conservatism of the component of form in the very relation {content/form}, as the forerunner of the clearly manifesting subjectivity of the "numerators" of the derivative relations {subject/object} and {subjective/objective}, likewise is not an obstacle for the deep syncretism of the components-constituents of this abstract relation.

Summing up what has been said, let us muster the courage to declare that, applied to all the above-considered relations, such a question about the establishment of the primacy and the assertion of the complete independence of the components of these relations from each other is not solvable and is meaningless *in principle*, since in the very content or contentful component of the initial (for all the concrete relations) relation {content/form} there is already **initially** present the subjectivity of the content with respect to the form, as in the component with a clearly expressed sign of the active leading principle in comparison with the more passive conservative component of the form, and nevertheless the sources of the qualitative difference of one component of this relation from the other (the sources of the distinction of the components of this relation) go back into the inseparable *syncretic* unity.

In the inanimate (thing) nature this, so to say, "subjectivity of the thing" manifests itself episodically and therefore in an explicit way is expressed rather weakly, indistinctly, veiledly, but meanwhile even there already serves as the underlay of all sorts of interactions, manifesting themselves in the form of collisions, impacts, destructions, explosions and, in the general case, of all sorts of changes (winds, hurricanes, fires, downpours, floods, earthquakes...).

As the intensity of content-form transitions intensifies within a series and through a series of highly specific relations, the indicated subjectness of the content-based component "fortifies" and increasingly confidently and distinctly "steps" outward, thereby revealing the obvious confrontation and antagonism of the two constituents, the two components of a certain unified relation, until, finally, it takes shape as an allegedly separate, autonomous, and content-based subject (man or, in some cases, a higher animal) existing independently of the form (i.e., the object, nature), which has in fact lost only **the clearly (visually)** expressed connection with the object (nature).

The notorious active principle, latently present in any element of reality (manifesting itself, for example, through the movement of electrons in atoms and molecules, or in the form of the so-called forces of gravity between celestial objects, or through streams of solar (cosmic) rays and the influence of electromagnetic fields, or in the form of earthly tornadoes, cyclones, volcanoes, etc.) — is the primordial prototype of that active content-based (subject) component of all inanimate and living matter, which subsequently, after passing through numerous intermediate forms, transforming and modifying beyond recognition, finally appears before us in the image or guise of the human

personality as a creator, a maker, a subject, while, however, being at the same time latently bound to the form-based passive (object) component in a single and integral {subject/object} relation. Thus, the mutual independence of form and content, as well as of object and subject in the cases examined, is highly relative — greater in some aspects, lesser in others; however, in any case, the reverse side of this apparent independence is their **hidden**, deep, essential unity and interdependence.

The subjective has grown out of the so-called objective, is its continuation, but only by other forms, and already for this very reason alone they (the objective and the subjective) cannot be considered completely independent from each other. The subjective includes in itself the **developed** content of the objective, — in some sense the initial (source) content of the object "refracted" by the subject. The subject — this is precisely the new form of the "ascending" essence of the object. But if the subjective contains in itself the sources and the developed part of the objective, does this not mean that same latent unity with the objective after the manner of the syncretism of the constituents in the relation {content/form}? And the fact that in the guise of the feedback connection the subject is capable of exerting an influence on the object also proves their single nature and basis. Thereby the independence of the object from the subject can be recognized as purely nominal, relative, and by no means absolute.

The historically accomplished and visually ascertainable separation or isolation of the subject from the object testifies only to the fact that by some part of itself the object is still contained and present in the subject and, consequently, represents also a part of their common system and therefore is dependent on it, — which, in essence, is confirmed by the possibility of the reverse influence on the object from the side of the subject.

Under the objective content of reality in its ultimate expression (like the notion of the absolute truth as the motion from the relative truth in the direction of the achievement of the absolute truth) is understood the **motion-development** of its (of reality) contentfulness by means of the forms of different levels **in the direction** of the acquisition of a single generalized form of the highest (maximally possible) contentfulness. In the course of such a motion-development, registered and fixed by the human organs of sense and thinking, there takes place the change of the forms of the representation and acquisition of the content on different levels: from the inanimate, further to the living-inanimate and, then, to the living-thinking-animate, differing by different correlations of the components of {subjective/objective} in their multilevel relations-forms. At that, each of the forms successively grows out of the preceding one, being, as it were, its **continuation** and remaining in the bundle (with the indispensable presence of the direct and feedback connection) with all the preceding forms-levels involved in the general spiral-cyclic content-formal motion.

Being most closely interwoven in one bundle, these forms of the motion-development of the objective content nevertheless (and precisely by virtue of the mutual connectedness) are permeated and mediated by the subjective form of the **conditionally finite** and highest (of those reliably revealed at the given moment) level, which is the form of human thinking (consciousness). This kind of mediation cannot but tell on the assessment of the objectivity itself (of the objective content) through the prism of subjectivity, i.e., conditions the impossibility of the separation and isolation of the properly objective content from the "admixture" of the subjective content, from the presence of the component of the subjective and the impossibility of the conduct of the assessment of the objectivity outside the presence of the constituent of subjectivity.

By virtue of the inevitability of the conduct of the assessment of the objectivity through the prism of subjectivity, the objective itself is penetrated by the subjective and is clothed in the form of the *generally accepted* and *universally significant*, which, however, does not prevent this form from being **the continuation** of *the objective* and at the same time *being this same objective*. The separate subjects or individuals are precisely for that reason similar to each other, for that very reason are like each other (both externally and internally), that in fact they represent the generalized (aggregate) form of the acquisition of **the single objective content** of reality, represented by *uniform fragments* at a quite definite level of its (of reality) motion-development.

However, the set of subjective contents realized through the aggregate or row of similar to each other subjects (individuals) acquires the status of the objective content not at once and not always. The subjective contents, represented by the abstract subjectively ideal forms, can be considered objective only then, when their objectivity is verified and confirmed by the succession of the contents of all the layers-forms of the generalized pyramid (see § 6-7) and, in the first place, by the possibility and admissibility of the expression ("substitution") of the superstructural contents of the summit forms of the pyramid by the contents of the primary material-thing forms lying in the foundation of that same pyramid. Outside such a verification, the contentfulness of the previously accepted universally significant (with a "touch" of the subjective) may turn out to be an ordinary lie, approved and affirmed by the collective majority in the expectation of its momentary gains and preferences. About the ways and methods of the establishment of *the objectivity of the content* of the subjective forms we will speak below.

Thus, the objective content — this is also, by and large, always only a relation of the type {subjective/objective}; in a pure form there is neither the one nor the other. About what form of the object can one speak outside its mediation by the subject? Outside the relations with the subject — this is merely an indeterminacy. The replenishing aggregate of the separate subjective perceptions of one and the same something and demonstrates by itself the approximation to the ever more complete expression of the

objective content of this something. The criterion of the completeness of the expression or comprehension of the objective in such a case can be only the volume (or the "quantity") of the objective contentfulness, which gives the "go-ahead" for the becoming and the success of the existence of this or that form.

Let us emphasize here once again that the subjective image of the object is not *the reflection* of the object, but *the continuation* in a specific form of its (of the object) developing content (like the continuing "ascent" of the essence of the object in other, different from the thing, forms).

So that complete independence of the object from the subject, as well as of the subject from the object, does not happen, — precisely by virtue of the syncretism of the connection of the contentful and formal components in the relations {subject/object}, {subjective/objective}.

The simplest and most illustrative example from everyday life in confirmation of what has been said — is the relation {child/mother}.
The "numerator" and "denominator" of the indicated relation correlate with each other as the components subject-object, change-basis, content-form in the corresponding relations {subject/object}, {change/basis}, {content/form}. With respect to its child, the mother, undoubtedly, acts in this case both as the basis, and as the form, and as the object — whoever, whatever might say on this account. However far from each other in space and in time the mother and her child might be, the mutual connection and interdependence are preserved forever — in the genes, in the tissues, in the thoughts, habits, behavior, way of life, preferences, etc., etc. Even by the modern, not so perfect, means of objective control to establish this kinship (or the existence of the common ineradicable **objective unifying basis**) presents no difficulties whatsoever.

§ 9. The point of view of diamat on the role of abstractions and subjectively abstract forms in the course of cognition. The interpretation of the term "interpretation"

In order to advance further in the exposition of our views and approach, one will have to stop for a while on the representations of dialectical materialism about the role of abstractions and the necessity of the recourse in the course of cognition to subjectively abstract forms.

The method of abstractions (or of abstracting) by the definition of the "Philosophical Encyclopedic Dictionary" [19, p. 7] — is a universal method of cognition, the logical foundation of the understanding of nature and social life, — both in the subjective sense, since by means of abstraction "we turn every thing into a logical category" [14, p. 131], and in the objective sense, since abstractions (categories of thinking) are the "expression of the regularity both of nature and of man" [12, p. 83].

The significance and depth of the elaboration of this method is testified by the following its characteristic: "Abstractions applied to the immediate sense data are called abstractions of the first order; the abstraction from the abstraction of the first order gives the abstraction of the second order, etc. Cognitive significance can be possessed by abstractions of any order, but special trust is deserved by abstractions whose results can be comprehended on material models. Such abstractions are called **real**, the rest — **ideal** (**idealizations**). The most important task of scientific methodology is the comprehension of the abstractions of a high order through the abstractions of a lower order or the replacement of the ideal abstractions by real ones. ...The most developed system of abstractions is possessed by mathematics, which itself in essence is the science about abstractions: they constitute its premise, method, and subject" [19, p. 7]. Here is also adduced one more extremely important, in our opinion, judgment concerning the fact that the ordinary comprehension, say, of abstract theories goes, as a rule, by way of **interpretation**.

The need for the analysis and systematization of the abstract constructions elaborated by thinking, as well as the above-listed diversity and hierarchy of the latter, show how important it is for man (the cognizing subject, the researcher) to be able to correctly assess the truthfulness of these constructions and to have at his disposal reliable **criteria** and **ways** of such an assessment.

As we see, diamat approaches the analysis of the purpose and role of abstractions quite seriously. What main thought is traced in the description of the method of abstractions? That one, that the understanding and interpretation of abstractions requires the expression of them through each other (the higher through the lower, and further both of those through the most thing-like and concrete — material ones). And the second important circumstance, noted here as well, points to the fact that the comprehension of abstractions goes, as a rule, by way of *interpretation*.

In the indicated connection it is necessary also, in passing, to ascertain what contentfulness diamat puts into the notion of interpretation. In the broad sense interpretation means "explication, explanation, translation into a more comprehensible language" [17, p. 502]. In science and logic this notion is treated as "the aggregate of the **values (meanings) attached** in some way to the elements of a certain theory (to expressions, formulas, and separate symbols)". And further: "The interpretation of the theoretical constructions of the developed fields of scientific knowledge bears, as a rule, a mediated character and includes in itself multistage [compare: multilevel, — Author's note] **hierarchical** systems of intermediate interpretations. The connection of the initial and final links of such hierarchies is ensured by the fact that **the interpretation of the interpretations** of a certain theory gives its immediate interpretation. Thus, **interpretation** is an instrument of scientific modeling. ...In the contentful natural-scientific and mathematical theories there is always implied a certain **interpretation**: such theories use only the

meaningful expressions, i.e., the meaning of each expression is presupposed from the very beginning to be known" [19, p. 215].

In continuation of the list of the adduced quotations one cannot but agree also with the following interpretation: "Contentful knowledge — this is such knowledge whose terms and statements have some value and meaning, i.e., a definite interpretation. **To be contentful and means nothing other than to have an interpretation**" [10].

And, finally, completing the quotation of the treatments of the term "interpretation", let us adduce one more judgment, according to which *the interpreting* of notions means nothing other than the revelation in them of the presence of *objective content* [7].

§ 10. The role of abstractions and subjectively abstract forms from the position of our representations

In view of the importance of the above-indicated questions let us speak thoroughly about what the subjective abstract forms represent, what is their role and what are, in the end, the criteria of the truthfulness of these forms — now already from the position of our representations.

As the row of the above-adduced (see § 9) interpretations and definitions shows, the process of cognition is not reduced to the necessity of the expression of the abstract forms exclusively or only through the thing forms, but solves the task of the successive revelation and confirmation of **the objectivity** of the contentfulnesses of all the forms present in the cognitive chain (from the thing forms, through the forms of sensations to the forms of thinking and within the framework of these latter — of the whole ramified hierarchy of abstract constructions and structures) by way of the expression of them through each other. In the final result this device or way of the mutual expression of the forms through each other and should lead to the establishment of the truthfulness or falsity of the "summit" subjective abstract forms.

Such a device or way in its broadest sense is called **interpreting**. In the most general case the main proof of the truthfulness of the hierarchical chain of the abstract forms turns out to be their interpretability (i.e., the possibility and admissibility of the interpreting of the abstract forms by more concrete forms). As one can already guess, the particular case of the technology of interpreting, known and applied since time immemorial, is the procedure of practice, reducing to the interpreting of the abstract forms by the forms in the overwhelming majority thing-like, mediated by the forms of sensations (or by the so-called empirical experience).

What, in the end, is the speech about here? In essence, about the intentions to have a substantiated possibility to express one through the other: the incomprehensible through the comprehended, the particular through the

general, the abstract through the concrete — and then this concrete, in its turn already, to replace by *the successive contentful abstract*, **in order to operate in the further investigations precisely with the verified abstract as with the next, more productive and effective means of cognition**.

In distinction from the contentfulness of the form-level of the sensual (the subjects of which can serve man and the animal) the content of the form-level of the ideal (the subject of which serves man with his thinking) within the framework, say, of the process of cognition of the above-mentioned object (the stone-boulder, see § 6) constitute the following abstractions (in the order of the increase of the degree of abstracting): the dimensions of the object (length, width, height); the form of the object (cylinder, cube, sphere, etc.); the weight (mass) of the object; the color of the object (the wavelength of the reflected light and its intensity); the hardness of the material of the object (by Rockwell, Brinell, Vickers); the strength of the object (for rupture, shear, bending, impact, etc.); the radioactivity of the material, etc., etc. All this by the animals (from the ant to the dog and further — up to the anthropoid) is simply not assessed; the knowledge of the above-listed properties of the object — this is from the field of the contentful ideal, having significance only for man as an "advanced" subject of cognition.

In the establishment of the truthfulness of the abstract forms (i.e., of the presence in them of objective contentfulness) it is necessary in fact to answer the question: does the found abstract construction or structure (as the product of the form of thinking) admit the replacement or expression by means of the concrete form of thingness and/or by means of the less concrete (than the thing) form of sensations, and to what degree is such a replacement possible and admissible? For example, in order to ascertain in the simplest way the truthfulness or justice of the abstract formula describing the notorious law of Boyle-Mariotte (PV = const: the volume V of gases is inversely proportional to the pressure P [11, p. 131]), it is necessary empirically or mentally to "replace" ("substitute" or "fill") this abstraction with concrete sensations; i.e., in the change of the position of the piston in the cylinder, for instance, by pressing on the piston rod by hand, to put in correspondence to every its position (which is registered in a visual way as visual sensations) the magnitude of the response force or of the back pressure of the piston on the hand (which again is registered by the organs of touch as tactile and muscular-motor sensations). If under a certain standard set of initial conditions (constant temperature and invariable mass of the gas in the cylinder), limiting the field of applicability or justice of this law, such a replacement is possible and admissible repeatedly, then this abstract product of the form of thinking can be considered true. And in this same case, as is seen, the practical actions and their results serve as the measure or way certifying the possibility of the replacement (of one or another degree of completeness) of the found abstract form (formula) by the concrete form of another, more "down-to-earth", more "low" level (i.e., by the measurement of the displacements of the piston and of the efforts

corresponding to them). Moreover, for the increase of the mentioned degree of the completeness of the replacement (for the purpose of the expansion of the boundaries of the applicability of the abstract form) the description of the abstract form (in this case of the formula) requires, as is customary, refinement and improvement, as a result of which the initial simple abstract form (the formula description of the law of Boyle-Mariotte) under other sets of the fixed initial conditions and parameters of the surrounding environment can take the form of the laws of Gay-Lussac, Charles, Avogadro and, in the end, under the corresponding set of initial conditions can be replaced by the universal abstract form with maximally expanded boundaries of its application. As a consequence of the produced refinements and the refinement of the initial form of the law, there appears the equation of Mendeleev — Clapeyron [22].

In other words, the essence of the practical actions or the verification by practice reduces to the establishment of the possibility and admissibility of the replacement or substitution of the content of a certain abstract form (in this case of the formula description of the law of Boyle-Mariotte) by the content of the form again more concrete (in this case by the content of the form of sensations). If the possibility of such a replacement is ensured and confirmed, then there is confirmed or certified thereby also the truthfulness of the abstract form. In the final result (let us note once again) the verification by practice in fact turns out to be the particular case or variety of the broader, generalized procedure of the establishment of the truthfulness of knowledge, which is the assessment of the possibility or admissibility of *the interpreting* of the contents of the abstract forms by the contents of the more concrete forms, i.e., by similar kindred practical examples and by the factual material being obtained (obtained). If the abstract form admits interpreting (i.e., the filling with concrete thing content, the conjugation and succession of the contents of the compared forms with the transition of them into each other), then such an abstract form can be qualified as *contentful* and *true*.

The establishment of truth includes the coordination of the contentfulnesses of the forms (the sensual and the ideal), the finding of the correspondence of the contents of the same forms and, as a perspective, the determination of the quantitative correlations between the volumes of the conjugated contents...

The question of the establishment and assessment of the truthfulness of knowledge and of the presence of *objective content* in the abstract forms by which this knowledge is represented — is always extremely actual, and not only for the scientific and highly intellectual spheres of human activity, but also for everyday life.

In the final result the most important in the process of cognition turns out to be the contentful linkage of the abstract forms with the concrete ones, admitting the interpreting or the expression of these abstract forms through

the preceding more concrete (including also the thing) forms-levels with the aim, in the future, **to operate with this abstract, as with a more powerful instrument of cognition in place of the concrete forms used with the same purpose**.

§ 11. Development as the trajectory of transformations in the course of contentful movement. The ways of the establishment of the presence and completeness of objective content

Thus, the trajectory of the contentful-formal transformations in the course of the "through" contentful movement looks as follows.

Taking for *the conditional* beginning of the contentful movement (and of the transformations of the forms) the form of thingness, we note the first transition of the content of this form (by virtue of the inevitability of the contentful-formal transformations, conditioned by *the principle of self-development*) into the content of the form of sensations; further we observe the transition of the content of the form of sensations (by way of the contentful-formal transformations, conditioned by the same principle of self-development) into the content of the form of thinking. Herewith the objectivity of the contents of the forms of the presented chain is assessed only in a mediated way — with the indispensable participation of the form of sensations and the form of thinking.

For the establishment of the presence of *objective content* in the thing forms of the surrounding world serve, in the end, not only the forms of sensations (the sense organs) of man, but also the sense organs of other representatives of the animal world. Therefore not only the thing-practical activity of man or practice turns out to be the way of the assessment of the contentfulness of the thing forms; in the case of the expression of the content of the indicated thing forms by means of the content of the forms of sensations of the animal world the similar means is the behavioral reaction of the animals.

The presence of *objective content* in the thing forms in the most simple cases is more impartially and reliably proved precisely by the comparison of the behavioral reactions (habits, grimaces, emotions, sets of sounds, etc.) of the other, besides man, representatives of the animal world. If people can agree among themselves as to the coordination of the reactions to one and the same object (which would mean the "dragging through" as **objectivity** of the notorious **general validity** of the opinions about the object as the result of a certain agreement between people), then to imagine a similar agreement between the animals in relation to the similar reactions to the investigated object is simply impossible.

On the stage of the transformation of the objective content of the thing forms into the content of the forms of sensations of the representatives of the animal world, including man, there occurs the filling and saturation of the

forms of sensations with the content (contents) of the thing forms. This is the stage of the accumulation by the forms of sensations of the so-called empirical experience. The establishment of the presence of *objective content* in the forms of sensations and the verification (assessment) of the content of the forms of sensations for the objectivity of this content is carried out by the procedure of practice.

The establishment of *the objectivity of the content* of the thing forms is performed by the comparison of the contents of as large as possible a number of the forms of sensations. In the coincidence or sameness of the contents of a row or a multitude of the forms of sensations there is made the conclusion about the objectivity of the content of the thing forms. If the consequences and results of the interactions of the forms of sensations with the thing forms (and of the thing forms among themselves) turn out to be approximately the same, then by such a coincidence of the contentfulnesses of the multitude of the forms of sensations of the representatives of the animal world, including man, there is proved the relatively independent of the separate forms of sensations *uniformity* of the content of the thing world, i.e., *the objectivity* of this *content*.

Besides, by the coincidence or identity of the contents of the forms of sensations (for a row or a multitude of the representatives of the animal world, including man) there is proved not only the presence of the common objective content in the thing forms, but also the objectivity of the contents in the compared forms of sensations.

Thus, at a certain stage of the movement-development of reality the content of its thing forms is transformed into the content of the more mobile and "advanced" forms, which become the forms of sensations of the representatives of the animal world, including man; in other words, the mentioned content of the thing forms "ascends", so to say, to a new level of its representation by the forms of sensations. The objectivity of the content of the thing forms, as well as of the contents of the forms of sensations, is established in a practical way (by the procedure of practice) — by the assessment of the possibility and admissibility of the replacement of the contents of some forms of sensations by the contents of other forms of sensations (i.e., by the carrying out of the indicated assessment as if "horizontally"), about which and should testify the sameness (coincidence) of the contents of these forms in their comparison. Even the very presence of the similar to each other or identical forms-carriers of sensations in the plural (for example, of human individuals) proves the succession of the contents of the form of sensations and the form of thingness and, in the final result, the objectivity of the contents of these forms.

This is that which concerns the linkage of the forms of thingness and sensations. Now — about the linkage of the forms of thingness, sensations, and thinking.

The objectivity of the contents of the abstract forms of thinking is verified and confirmed by way of the comparison and the establishment of the presence in these abstract forms of the concrete content, one and common to a certain degree for the whole linkage of the forms of thingness, sensations, and thinking.

The objectivity of the content of the more abstracted (in relation to the forms of thingness and sensations) forms of thinking is proved by the possibility and admissibility of **the approximate** expression or replacement of the content of the abstract forms by the contents of the more concrete thing forms, mediated by the forms of sensations. Besides, at the level of thinking itself, for the confirmation of the truthfulness of the purely (highly) abstract forms-products of thinking there can be attracted the less abstract forms-products of the same thinking, already having or having received the status of genuine knowledge (the carriers of objective content) at the preceding stages of human activity. In this case the speech is about the carrying out of the assessment of the contentfulness of the forms as if "vertically".

Further, to reveal the objective contentfulness of a certain abstract form-product of thinking — this means to establish (by way of comparison) the presence in this form of the content common with the contentfulnesses of the more concrete conjugated forms, and on this basis to make the conclusion about whether the content of the abstract form "fits" into the chain of the contents of the preceding concrete forms and whether it continues by itself this chain; the positive answer to these questions means the positive answer also to the question of whether the content of the investigated abstract form can in such a way lay claim to *objectivity*.

Science is considered a skeptical method of cognition, asserting itself over the course of 400 years in the conditions of the most severe competition of the views on this or that phenomenon (in the sense of the explanation of its foundations and the forecasting of its consequences). What, in such a case, ensured the prerogative of the scientific approach and the superiority of the way of scientific thinking (and of the obtaining of knowledge) in relation to the other methods? The installation and aim exclusively at **the objectivity** of the contents of the obtained knowledge, certified by *the succession* of the conjugated and passing into each other *objective contents* of the forms interpreting this knowledge.

The procedure of the establishment of the presence and volume ("quantity") of objective content in this or that aggregate form, which is, say, the multilevel form of man himself, requires the assessment of the presence of the obligatory direct and reverse connection between the levels in their aggregate (aggregate form). Practice or the thing-practical activity of man precisely and acts in the role of the way or device confirming or certifying the presence of such a connection. The presence of the immediate connection between the levels testifies to their succession.

One way or another the process or procedure of the establishment of truth or of the truthfulness of the subjectively abstract forms is always carried out in a spiral-cyclic way of the return to the sources (to the foundation — to the thing forms and the forms of sensations) and thereby of the return "to oneself at a new level" (in which, in fact, is seen the essence both of the reverse connection, and of the contentful enrichment, and of the change-movement-development in the direction of the acquisition of the highest contentfulness — i.e., of objective content — by the whole aggregate of the forms).

If in the course of the carrying out of such a procedure there is observed the absence or instability of the direct and reverse connections between the subjective and objective levels (the components in the relation {subject/object}), then precisely on this basis and should follow the unambiguous conclusion about the untruthfulness, incorrectness, incorrectness, inaccuracy of the verified subjective form — the product of thinking (knowledge, judgment, assertion, definition, notion, formula, theory, conception, teaching, model, etc.).

In this connection it would be appropriate to add also that by virtue of the peculiarities of such a reciprocating movement (in which on any section of the path the very course or the natural spiral-like character of the development of reality presupposes the return to the foot-foundation of the pyramid, the "feeding" or enrichment of the acquired content by the primordial life-giving sources, as well as its "reverse" movement to the re-forming summit, to the re-forming contentful abstractions), not only evolution, but also revolutions, and crises, and conflicts, and other upheavals are not excluded, not finished, and not completed (as this might be desired by the uninitiated and uninformed man as to the "mechanism" of the realization of the dialectical movement).

§ 12. The criterion of truth — contentfulness. Development as the movement of the forms of reality in the direction of the possession of the highest contentfulness

As it was already possible to notice, the central notion on the basis of which our narration is built up and which will be even more persistently woven into the canvas of the further reasonings is the notion "content" and its derivative — "contentfulness" [soderzhatel'nost'].

In accordance with the point of view reproduced above, development represents the "ascent" of objective content by *the multilevel*, but conjugated one with another successive forms, which in the measure of the mentioned ascent become ever more abstract and capacious, shifting or displacing into the field of the ever more contentful *subject* forms, i.e., in the direction of the "numerators" of the known relations {contentfulness/form}, {subject/object}, {subjective/objective}, {abstract/concrete}, {change/foundation}, etc.

Correspondingly to our approach the development of reality is carried out in the direction of the increase of the contentfulness of its forms, which, occupying new informative levels, become also ever more abstract.

Let us now set ourselves the following question, actual for us: in what relation with the contentfulness of the forms is their truthfulness?

According to diamat, truth — this is *the objective content* of the sensual, empirical experience, notions, ideas, judgments, theories, teachings, and of the integral picture of the world in the dialectics of its development [19, p. 226]. Since content is not formless, and form is not contentless (see § 8), every content, including also that answering to truth, appears in reality or is realized only through form and not otherwise, — to which, in fact, and is pointed in the very definition of truth. In other words, truth does not manifest itself in reality otherwise than through **the forms** (including also the forms enumerated in the definition, such as: notions, judgments, ideas, theories, teachings, empirical experience, etc.), and in the indicated aspect the question of whether truth is ***the form*** *of the manifestation of objective content* is a rhetorical question.

By what sign (indicator, quality, property, component, constituent, etc.), proceeding from the adduced definition, should one assess **the truthfulness** of the forms, and including also the abstract forms of knowledge (notions, ideas, judgments, theories, teachings, etc.)? Obviously, by the presence in these forms of *objective content*. In other words, the contentfulness of the forms is subject to assessment, and, it seems, precisely this indicator (sign, quality, property, component, constituent, etc.) and will serve as the **criterion** of the assessment of *the truthfulness* of this or that form.

Taking into account the *syncretic* inseparability of content and form, about which was said above, every form "from birth" is endowed with a certain contentfulness, but for human thinking the orientation serves and arouses interest, as a rule, the *maximal* contentfulness and, correspondingly, the form of the expression of the highest contentfulness. Therefore it is most logical to suppose that the most contentful form (i.e., the form *maximally "filled" with objective content* or the form possessing the highest contentfulness) and will be the true form. Thus, **truth**, from the position of our representations, — this is the form of the expression of ***objective content*** (i.e., the form of the expression of *the highest, maximally achievable contentfulness*) of reality or of its separate element at every definite stage of its (of reality) development.

How, by what path, way, by what means, procedures, technologies can one assess the volume or "quantity" of *the contentfulness* of this or that investigated abstract form? By way of the expression or "substitution" (at least mental) of the content of the investigated abstract form by the already assessed, verified, approved, and affirmed by man (i.e., endowed with the

status of *true*) contents of the more concrete forms. Such a procedure is named *practice*, and within the framework of the broader application of such a procedure or technology — *interpreting*. In both cases the mentioned procedures reduce to the assessment of the possibility and admissibility of the expression or substitution of the content of the investigated abstract forms by the contents of the more concrete and already verified forms (after the manner of the above-described in § 10 way or procedure of the assessment of the truthfulness of the abstract form-formula of the law of Boyle-Mariotte).

Here is one more example of the assessment of the contentfulness and truthfulness of the forms. Simply speaking, if the volume of a spherical vessel of radius R is expressed, according to the "machinations" of abstract thinking, by the formula $(4/3)\pi R^3$, then it does not constitute any difficulties to verify or assess the volume calculated in such a way, pouring into the vessel water or pouring river sand. By the assessment of the contentfulness of the form of thinking (i.e., of the above-indicated formula), carried out in this case by the way or procedure of the substitution of the content of the abstract form of thinking by the content of the concrete form of sensations (filling the vessel with the *then* measured quantity of water or sand), one can ascertain the truthfulness of the formula, i.e., *the truthfulness* of the form-product of abstract thinking. And further, this abstract form (the formula for the computation of the volume of the sphere), verified a million times for the correspondence or "coincidence" of its content with the content of the form of sensations, can, in its turn, be used for the verification and assessment of the contentfulness of the other forms, to refer to it and to use it in the further investigations as the foundation with *the confirmed and certified truthfulness*.

Thus, that **criterion** (sign, indicator, quality, property, component, etc.) by which one should assess **truth** or in the general case **the truthfulness** of the arising, existing, and disappearing forms — this is *by no means practice*, but **the contentfulness** of the forms. *Practice*, however, — this is merely the procedure (process) of the carrying out of such an assessment, and moreover limited mainly by the thing field of the activity of man. In relation to the broader field of application, including the assessment of the truthfulness of the abstract constructions, structures, and edifices of various hierarchy and nesting, such a procedure is named **interpretation** (see § 9) or **interpreting**. In this connection practice turns out to be merely the particular case, the narrow layer of the more extensive procedure or technology of the establishment of the truthfulness of the forms — interpreting. Thereby practice — this is also interpreting, i.e., the replacement (often mental) of some forms, as a rule more abstract, by the more concrete and verified forms (in this same row is found also the process of modeling).

[*Practice* — this is, above all, *a process*, and therefore in a certain sense an indeterminacy, which in itself is not very suitable for the definition of *a*

criterion. From the position of our reasonings *the criterion of truth* is not practice itself or the thing-practical activity of the subject with its results, but *the presence* and *volume* or "quantity" *of objective content* in the investigated abstract forms, which and is established with the help of the procedure of practice or in the general case of the technology of interpreting.]

The genuine criterion of the assessment of the truthfulness of the abstract forms-products of thinking is the contentfulness of these forms. Practice, however, or interpreting — this is the technology (procedure, way, process, means, etc.) of the establishment of the presence and "quantity" of contentfulness (i.e., of *the presence and "quantity" of objective content*) in the investigated forms, and hence, in the final result, also of *truth* or of *the truthfulness* of the investigated forms.

On the first stage of the realization of the mentioned technology there is established *the presence* of objective content (contentfulness) in the investigated forms by way of the assessment or verification of the possibility and admissibility of the as complete as possible substitution (expression, replacement) of the contents of the investigated forms by the contents of the more concrete forms (already verified and with the confirmed truthfulness), i.e., there is established the admissibility of the replacement of one by the other (the unknown by the known, the incomprehensible by the comprehended, the irrational by the rational, etc.). By the results of such a verification there is made the conclusion about the interpretability of the investigated forms, i.e., about the succession of the substituting and substituted contents. The interpretability of the investigated forms in such a case means the confirmation of the presence of a certain "quantity" of objective content (contentfulness) in the investigated forms.

On the second stage there is assessed *the completeness* of such a substitution (i.e., there is determined the "quantity" of the contentfulness of the investigated forms) by way of the finding or establishment of the as large as possible number of the concrete forms (already verified and with the confirmed truthfulness) suitable for the carrying out of the above-indicated replacement. By the results of the performed assessment there is made the conclusion about the completeness of the contentfulness, and then also about *the truthfulness* of the investigated forms.

Both stages can be united into one and realized simultaneously. Thus, the interpretability of the investigated forms and the number of interpretations give a more or less complete representation about the status (truthfulness or untruthfulness) of the investigated forms.

On the basis of the above-adduced reasonings one can come to that conclusion that the genuine **criterion of the truthfulness** of the forms serves their **contentfulness**, and *the status of the true form or of truth*

answers to the form with the maximally achievable (at this or that stage of the development of reality) contentfulness.

What, then, is *the contentfulness* of this or that form? One should suppose that in application to the concrete objects and other material elements of reality the contentfulness (as the predominantly internal hidden component or constituent) of the concrete forms must nevertheless be represented from outside by means of some concrete external attributes of these objects or elements. Can the manifestation of contentfulness be, for instance, the beauty of the form? Probably, it can. Beauty may well turn out to be one of the attributes suitable for the assessment of contentfulness, and consequently, also for the assessment of the truthfulness of a certain concrete form. The same thing, obviously, can be said also about such manifestations of the contentfulness of the concrete forms as simplicity (or, on the contrary, complexity), economy (economicalness), usefulness, pragmaticalness, rationality, systemicity, integrity, originality, etc.

Now as to the contentfulness of the *abstract* forms: theories, conceptions, paradigms, plans, schemes, formulas, projects, diagrams, models, teachings, etc. Beauty (for instance, mathematical beauty and the elegance of the formula) also can turn out to be the external manifestation suitable for the assessment of the contentfulness of this or that abstract form. The external embodiment of the contentfulness of the abstract forms may well be also the clarity of the judgment, and the harmony of the exposition, and the demonstrativeness of the assertion, and the laconism of the thought (idea), and the logicality of the conclusions, and the non-contradictoriness of the theory, and the general validity of the results, and the informativeness of the diagram, and the simplicity of the scheme, and the compactness of the planning, etc., etc.

However, in whatever clothes the contentfulness of the concrete and abstract forms may dress itself, in both cases the contentfulness in the person of its above-indicated manifestations must be confirmed by the interpreting of the assessed forms either by the results of the thing-practical activity (practice), or by the repeatedly verified and approved results (products) of the theoretical (mental, subjectively ideal) activity of man. The procedure of interpreting, however, presupposes under itself the as complete as possible expression, replacement, or substitution (at least mental) of the content of the investigated (verified) abstract form by the contents of the more concrete forms. Then by the interpretability of the forms (i.e., by the possibility and admissibility of the contents of the investigated forms to be expressed or substituted by the contents of the more concrete and verified forms) there is proved the presence of *objective content* in the investigated abstract forms.

The maximal or highest contentfulness, and hence also the truthfulness of the investigated forms, in its turn, is proved by the possibility and admissibility of the expression or substitution of the content of the abstract

form by the concrete contents of the *maximally possible* number of the concrete forms of different levels of concreteness (by the practical examples, the factual material, the results of the numerous experiments, the repeatedly verified and affirmed by the scientific community results of the theoretical investigations, etc.). Only then the form with the contentfulness assessed in such a way can lay claim to a place in the list of the *maximally contentful* abstract forms, and, consequently, also of the *true* forms. In other words, the truthfulness, i.e., the maximal or in the extreme case the sufficient contentfulness of the abstract form, must be certified and confirmed by its interpretability (the possibility and admissibility of being expressed) by the contents of the other forms:
— the more concrete, i.e., of the more "low" (by hierarchy) level of the forms;
— of the abstract forms whose truthfulness is confirmed earlier and does not arouse doubts,
which and would testify to the succession of the contents of all these forms of different levels, and, consequently, also to their *objectivity*.

Here it is appropriate to return to the criterion of truthfulness proposed by A. Poincaré (see § 3). Analyzing in detail the statement of the French scientist, one can see that from his point of view the "internal harmony of the world" and is the objective contentfulness conditioning the truthfulness of this (real) world.

Can the harmony of the world be the manifestation of its contentfulness? Obviously, it can, as also beauty. The matter remains only for the small — to decide how to assess this contentfulness (i.e., the internal harmony of the world or of reality), in what conventional units or standards one should express it, in order to reveal the highest degree (level) of this contentfulness, which and will answer to the *true* form of reality.

And with all this the assessment of *the contentfulness* of the investigated form (*the internal harmony of the world* by A. Poincaré) must be conducted, as was noted above, in full correspondence with the technology of interpreting (i.e., with the establishment of the admissibility and completeness of the substitution of the content of the investigated form by the contents of the possibly larger number of the concrete forms, as well as of the abstract forms whose truthfulness is confirmed earlier and does not arouse doubts).

In view of the special importance of the considered question let us reproduce once again the substantiation of the above-advanced criterion of truth (of the truthfulness of the forms of reality).

Since the multitude of the dictionaries, including also the philosophical ones, interpret *the criterion* as *the sign* on the basis of which there is produced the assessment of something [16, p. 130; 17, p. 664] and by which one can determine the truthfulness or falsity of the judgment [21], as well as as the

"*distinctive mark* by means of which we can recognize it (truth)" [6], then with all confidence one can say that such a sign or indicator in the case of the assessment of the truthfulness of the forms (i.e., in the process of the search and establishment of truth) is ***by no means practice***.

Here, for example, is what is reported in the "Encyclopedic Dictionary" of F. A. Brockhaus and I. A. Efron [21]: "The formal criterion of truth serve the logical laws: everything that does not contain in itself an internal contradiction is logically possible, but in order to be true, it must correspond also to the material criterion, i.e., to **the factual content** of the thought." As we see, in the final account and here as the criterion of the truthfulness of the forms there is advanced their factual (*objective*) **contentfulness**, which by no means diverges from our representations and our position. After all, to the most correct and appropriate in this connection question — by what uniform sign or indicator one should assess the truthfulness of the abstract forms, what quality or property of the abstract form is subject to assessment for the revelation and certification of its truthfulness — the answer suggests itself the following: the different forms can be correctly compared, juxtaposed, assessed only by the sign inherent to any and every form and named *contentfulness* (i.e., by the completeness or filledness of the form with content). The most true, genuine, and actual is the form possessing the highest contentfulness at the given moment of its (of the form) development; the less contentful form is both less true, and less reliable, and less effective, and less actual.

The filledness of the abstract form with internal content is assessed, established, verified by the external manifestations of the form, such, say, as beauty, rationality, simplicity, obviousness, laconism, etc. But how, in what manner, by what path, way, with the help of what procedure is such an assessment performed — this is already a question of technology. By practice is meant the procedure of the assessment of the truthfulness of the abstract forms, connected with the determination of the possibility and admissibility of the substitution of the content of the abstract form by the contents of the concrete forms, namely — by the contents of the thing forms, mediated by the forms of sensations. From the heights of the present day this procedure is somewhat "narrow" in order to embrace by itself the whole broadest spectrum of the fields of the activity of the modern researchers. Therefore for the assessment of the truthfulness of the forms in all the fields of the activity of modern man there is applied the procedure named interpreting.

The technology of interpreting is connected with the determination of the possibility and admissibility of the as complete as possible substitution of the content of the abstract form not only by the contents of the forms of sensations and of the thing forms, mediated by the human sensations (as in the case of the procedure of practice), but also by the contents of such abstract forms-products of thinking whose truthfulness is preliminarily verified and repeatedly confirmed in the course of the preceding activity of man (the speech is about the practical examples, the empirical data, the

factual material, the formula expressions and computations, the schemes, the models, the theories, the teachings, the axioms, the postulates, etc., etc., whose truthfulness and actuality does not arouse doubt, above all, in the scientific circles or in the milieu of the learned public). In such a connection the procedure of practice turns out to be the particular case of the technology of interpreting; i.e., practice also belongs to the technology of interpreting, but with that only difference that here the procedure of the assessment of the truthfulness of the forms is carried out by the substitution (possibly mental) of the contents of the abstract forms by the contents mainly of such concrete forms as the forms of thingness, mediated by the forms of sensations.

Let us emphasize, thus, once again, that not practice or in the general case the technology of interpreting serve as the criteria of the truthfulness of the abstract forms, but such an omnipresent component or constituent of all the forms as their internal contentfulness (filledness or the degree of the filledness with content). The procedure of practice or the technology of interpreting allow only **to assess** the presence and completeness (i.e., the "quantity") of *the contentfulness* (and hence, also the degree or level of the truthfulness) of the investigated forms. And now on the basis of the understanding of **the essence** of the criterion of the truthfulness of the forms there appears the possibility to **meaningfully** develop its (of the criterion) numerical standards — to build, say, scales, diagrams, nomograms, rating systems, etc. for **the numerical (quantitative) assessment**, firstly, of *the contentfulness* and, secondly, of *the truthfulness* of the all possible forms.

The criterion of the assessment of the truthfulness of the form — this is its *contentfulness*, and the level of the truthfulness or genuineness of the form is determined by the completeness of the content or by the "quantity" of this very contentfulness. Hence truth — this is the form *of the highest contentfulness or of the maximally achievable completeness of the content* at every definite moment of the development of this form. Any form of the *highest contentfulness* (i.e., the form *maximally filled with content*) at every given moment of its (of the form) development and is the **true** form. In such a context it is easily understood that in its essence **absolute truth** — this is an iterative process of the infinite approximations to the exhaustive (final and complete) expression of *the objective content* of the developing reality by the diverse its (of reality) forms of *the highest contentfulness*.

If practice (as a procedure, as a technology, as a way, as a process, etc.), **erroneously** acting until now in the role of the criterion of truth, does not yield to the quantitative assessment and therefore cannot serve as the informative criterion in the establishment of the truthfulness of the forms, then *the contentfulness* of the forms — this is such a sign or indicator which organically, in a natural way is suitable and adapted for such an assessment.

Someone, surely, will say what nonsense is being carried on here — how can one measure *the contentfulness* and the more so *the truthfulness* of something? The answer is simple: man from time immemorial is engaged only in that he assesses and measures *the contentfulness* of the all possible forms of reality. From now on he will do this more meaningfully.

In every sphere of human activity there exist their own rating systems, scales, graphs, tables, diagrams, nomograms, etc. for the assessment of the contentfulness of the diverse forms. The metric system of measures, the systems SI, CGS, etc. with their conventional units and standards (kilograms, meters, seconds, etc.), the monetary system, the virtual system Bitcoin (or something similar crypto-currency, coming to replace and as the continuation of money), the indices IQ, Hirsch, RSCI, etc. (as the attempts of the expression in conventional units of the level of the intellect of man), the humanistic systems of the assessment of spirituality (as the attempts of the assessment in conventional units of the spiritual potential of man) — all this is the examples of the rating systems allowing to assess *the contentfulness* of the all possible forms of reality, abiding at its different levels and in different fields. The "quantity" of the measured *contentfulness* of the forms and answers to the different approximations of these forms to the absolute truth or to the form of the "exhaustive" expression of *the objective content* of reality (in this or that its field).

Man as one of the multitude of the forms of the multilevel reality, in his turn, represents a multilevel formation. But from the ancient times and until now *the contentfulness* of man is determined mainly by the level of the material accumulations, present and, unfortunately, dominating (for now) among the other levels in their hierarchical aggregate. Money, herewith, and is the quantitative measure of *the contentfulness* of this dominant (i.e., of the dominating level in the composition of the aggregate of all the other levels of man), why they and occupy a special place and are the most widespread rating system among the other systems and scales of the quantitative assessment of *the contentfulness* of the forms. Being, however, the measure of the contentfulness mainly of the "down-to-earth" material levels and sublevels in the composition of the multilevel form of man, the rating monetary system by virtue of the indicated circumstance is not so universal as it seems, and is "powerless" in relation to the assessment, say, of the spiritual and other summit spheres and levels of the "abiding" of the *true contentfulness* of the human "I". Spirituality or morality, being the aggregate of the deep human feelings, mediated by the human thinking (consciousness), in general poorly yields to the quantitative assessment with the use of the existing "down-to-earth" standards. For the assessment of the spiritual potential of man there is required a special filigree-refined scale.

Money — this is a primitive "measurer" of the volumes of the content or potential of the forms mainly of the material-thing level (and not a certain "universal equivalent"; the incorrect or outdated basic representations sometimes seriously hinder the understanding of the essence of the

problem), behind the "monumental" facade of which is hidden the unpretentious essence of this "gasket" as one more superfluous intermediate element (similar to the notions "reflection" or "copy" in the known epistemological theories), the need for which will fall away in the measure of the perfection of the organization of the social structure.

In the same way as the scales, the clocks, the various kinds of counters (electric, gas, water) and other counting devices serve as the simple measurers of *the volumes of the content* or of **the contentful resource** of these or those forms of different levels (of electric energy, heat, water, gas, oil, air, time, etc.), money — this is also a "mechanical" measurer of the contentful potential of the all possible forms-levels, assessed again by the substitution of the contents both of the concrete and of the abstract forms by the content of the very concrete material form. In other words, money — this is also a trivial (with the claim to universality) rating system for the measurement of the "quantity" of the contentfulness of the forms.

As is known, every movement forward consists in that a step is made from the achieved, and all the perspective forms (such, say, as the plans, the projects, the programs, etc.), before receiving the approval for their embodiment and application, are verified by way of the replacement (at least mental) by the existing (achieved) and already applied by man forms. If the contents of the investigated (verified) forms can be substituted (as completely as possible) by the contents of the already used forms (i.e., of the forms endowed with *objective contents* — of the true forms), then there is made the conclusion both about the sufficient contentfulness of the investigated forms, and about their suitability for the further application.

"The success of human practice", consider the Marxists, proves the correspondence of the representations of man "to the objective nature of things" which he perceives [11, pp. 134-135]. The speech here is about the correspondence of the content of the products of human thinking (of these or those abstract subjectively ideal constructions and edifices) to the content of the thing world, i.e., about the truthfulness of the abstract forms produced by human thinking, which for man as the subject of cognition is the most interesting, valuable, and important in *the first place*. The condition of the "success" of the application, and hence, also the sign (criterion) of the truthfulness of the abstract form-product of thinking will be the correspondence of its content to the content of the form of thingness, or, in other words, the possibility and admissibility of *the as complete as possible* substitution of the content of the abstract form of thinking by the content of the thing forms, mediated by the forms of sensations. In the final result the presence of *objective content* in the investigated abstract form — here is the criterion of the truthfulness of this form, and hence, also of the "success" of its application in practice. As we see, neither "human practice" nor "success" are the key words in the above-adduced assertion; the determining factor of the success of the practical application or of the truthfulness of this or that abstract form turns out to be its *objective contentfulness*.

Thus, as to the recognition of the special role and significance of practice in the assessment process of the establishment of truth there are no objections with that only difference, however, that practice in this case is not the criterion of the truthfulness or of the success of the application of the investigated abstract constructions, but serves only as the device or way of such an assessment. The genuine criterion of truth or of the success of the application of the abstract forms turns out to be *the contentfulness* of the verified forms, and more precisely — *the "quantity"* of this contentfulness, on the basis of which it becomes possible, finally, to ***consciously*** assess *the truthfulness* of the investigated forms **quantitatively**, i.e., by number or by "digit".

If the sense of practice reduces to the assessment of the possibility and admissibility of the substitution of the content of the abstract forms by the contents of the forms mainly thing (and more precisely, by the contents of the forms of sensations), then the technology of interpreting is represented by a more expanded set of the means and devices of the establishment and verification of the truthfulness of the abstract forms: and by the forms of sensations, and by the already verified, approved, and recognized (affirmed) in their truthfulness abstract forms of different levels and constructions. The multilevel abstractions with the established and confirmed truthfulness — this is also the steps of the "ascent" of the essence or of *the objective content* of reality.

In the former times the appeal to the procedure of practice was sufficient; today this procedure must be expanded by way of the *conscious* inclusion in its assessment arsenal of the set of the modern and more effective means — otherwise man, relying on the false or unskillfully and erroneously chosen orientations ("untrue" truths), risks losing the adequacy of the perception of the world and disappearing as a species or a certain form-level of reality.

The well-known expression (the prototypes of which with great probability are found in the works of G. W. F. Hegel): "Truth is always concrete", — is completely correct from that point of view that truth at every given moment — this is merely *the concrete limited form* of the next approximation to the all-embracing expression of the moving, developing content (as the equivalent of the "extracted" from the depth of the abstract essence) of reality. Besides, the truthfulness of the contents (i.e., the completeness or the "quantity" of *the contentfulness*) of the investigated abstract forms-products of thinking (notions, judgments, projects, theories, conceptions, philosophical systems, teachings, etc.) is established by the admissibility of the interpreting and by the number of the interpretations of these investigated forms by the known point finite examples: by the factual material, by the results of the thing-practical and theoretical activity, as well as by the already verified and confirmed abstract forms. In such a section it is easily understood that all the perspective forms laying claim to the

acquisition of the status of the true forms also subsequently will turn out to be *the concrete relative truths* by virtue of *the interpreting* of them by the *concrete finite* examples-results of the preceding practical and theoretical activity in the process of the establishment of their truthfulness.

The "success" of the existence (i.e., the truthfulness, actuality, viability) of any real form is determined by its contentful resource or again by the "quantity" of its contentfulness. The contentful resource, in its turn, is made up of the multitude of the constituents; for such a form as, for example, the state — this is by no means only the developed economy, but also the intellectual-spiritual potential of the population, the reserves of the natural resources and the defense potential, the self-sufficiency, the high adaptability of the population to the changing conditions with the preservation of the adequacy of thinking, etc. In application, say, to the living forms — this is and the endurance of the organism, and its survivability, and its energy-arming or energy potential, and the duration of life (without the loss of quality), and the adequate reaction to the influences and the ability to adapt to the changing conditions of the external environment, and again the self-sufficiency, etc.

Good-bad, better-worse, higher-lower, wide-narrow, much-little, more-less, deep-shallow, useful-harmful — the origin and the wide use of these and of the multitude of the similar pairs of comparisons is also conditioned by the need in the assessment of the completeness of the contentfulness or of the contentful resource of the all possible forms of reality mainly at the everyday level.

Analogously the success of the actions or the successfulness of the activity of man is determined by *the contentful resource* of the form of man (in the general case — of mankind) and of his thinking.

Any form-level lives or exists, *enriching* itself in a natural way, until such time as any of the subforms-sublevels entering into the composition of the whole aggregate of the subforms-sublevels of the form does not express by itself the maximally achievable for this subform-sublevel contentfulness. With the onset of the moment of the expressedness of the maximal contentfulness by some subform-sublevel in the composition of the existing form (which answers to the achievement of the peak of the activity of the whole form) there begins to prevail the progressive taking away of its contentfulness by the neighboring forms-levels. For this reason the form stagnates and regresses, being "dragged apart" into parts and assimilated by the other more active forms-levels by virtue of the most severe competition between them and of the inexhaustible "demand" for contentfulness. Every "gaping" form, having stopped in the increase of its content (contentful potential) and having slowed down the development, the competitors immediately drag apart into the constituents, replenishing thereby the reserves of their contentfulness correspondingly to *the omnipresent principle of self-*

development. *The boundaries, the resource, the quality of every form are conditioned by the volume of the contentfulness accumulated in it*.

All the forms-levels have to prove their *viability* (i.e., the ability to increase and multiply their potential-contentfulness) in the hard competitive struggle. Man — is not an exception, but a specimen of the typical form submitting to the action of the universal "mechanism" of the development of reality — *the principle of self-development*.

The very existence of any form takes place only thanks to the increase and preservation of the rates of the growth of its contentfulness, and the very fact of its existence testifies to the presence in it of the sufficient volume of contentfulness. On the other hand, the highest contentfulness of this or that level is demonstrated, confirmed, and certified by the stability of its form.

Thus, the "success" or the duration of the stable existence of the form is the consequence and the indicator of the presence in this form of the sufficient volume of *contentfulness*, and this subject-to-assessment contentfulness (of the ever-increasing degree of abstractness) of the forms must be tied up with the concreteness of the preceding forms, i.e., admit the interpreting by the preceding more concrete forms-levels.

What advantages promises such, it would seem, insignificant refinement concerning the advancement and substantiation of the *correct* and *genuine* criterion of truth?

In the "guise" of the newly advanced criterion the researcher receives at his disposal an effective instrument for the carrying out of the ***conscious*** comparative *quantitative* assessment of *the contentfulness* (and hence, also of *the truthfulness*) of the diverse forms and, correspondingly, of the building of them by rank. And already on this basis there opens the possibility to take the more competent and weighed decisions concerning the determination of the direction of the further investigations of reality with the reliance on the meaningfully selected **true** its forms.

§ 13. The technology of interpretation as a universal way of the assessment of the contentfulness of forms

Let us examine in greater detail the technology of interpretation applied in the assessment and establishment of the contentfulness and truthfulness of the investigated forms.

As it has already been clarified above (see § 9), "to interpret" — means to express something abstract and insufficiently definite through the thorough, definite, and concrete; to translate the incomprehensible into the language of the comprehensible; to present the new and unusual by means of the known and habitual. In an analogous way to interpret a notion or to give a definition — this means to express the particular through the more general, or, in the

words of V. I. Lenin, "this means, first of all, to bring the given notion under another, broader one" [11, p. 142]. In the indicated cases one thing is expressed through another: something that is only just taking shape, unclear and vague — through the established and definite preceding one. In this sense *the technology of interpretation* fits into the channel of *the principle of self-development* (and submits to this principle), which determines and prescribes the unitary directionality of development to all real processes.

In other words, interpretation — this is both the elucidation (explication) of abstract constructions by way of the recourse to the content of concrete forms; and the expression of the irrational through the rational; and the assignment of concrete sense-values to abstract elements: images, notions, judgments, expressions, computations, schemes, formulas, symbols, etc.

All the scientific devices of the establishment of truth, including the explanation and forecasting of the results of investigations (among which there turn out to be: the modeling of processes, the reproduction of real situations, the simulation of behavior, the anticipation of consequences, etc.), relate one way or another to *the technology* (method, way, procedure) *of interpretation*.

The most marketable and widespread way of the confirmation of the contentfulness of abstract forms — this is the interpretation of these forms by the habitual and accepted (accepted by reason, by the everyday consciousness, or by the so-called common sense) particularities and concretions.

The recourse to facts (examples, empirical data, approved results of theoretical activity) with the aim of the expression of the contents of the investigated abstract forms by the contents of more concrete forms — there is the interpretation of the abstract by the concrete (such a practice is applied in relation to all subjectively ideal forms from different spheres of human activity, and not only to the products and results of theoretical investigations).

The ability or *suitability* of an abstract form to interpretation by other, more concrete forms (i.e., the interpretability of the abstract form) by no means yet speaks of and does not testify to the sufficient contentfulness of this form, but nevertheless — this is the first obligatory condition on the path of the certification of the truthfulness of this or that form. The second obligatory condition in the establishment of the truthfulness of a form — the determination of the completeness of its contentfulness and, consequently, of the level of its truthfulness depending on the "quantity" of this contentfulness, conditioned by the number (and as large as possible) of the interpretations of the content of the investigated form by the contents of more concrete forms.

By the admission and conclusion of the Marxists themselves, the criterion of truth adopted by them in the theory of cognition, built on the basis of practice, is to a certain extent indefinite, i.e., is not exhaustive (necessary and sufficient). But the point here is by no means in the perfection-imperfection of the procedure (practice) as a criterion; the indefiniteness of any of the possible criteria of truth in any case is conditioned by the fact that, firstly, none of the investigated (tested for truthfulness) real forms can be *contentfully exhaustive* or *absolutely contentful* and, secondly, *the highest contentfulness* of none of the forms can be confirmed by an infinite number of interpretations. Here the principle of reasonable sufficiency comes into force, on which one should orient oneself in practice in the establishment of truth with the use of the technology of interpretation.

The same thing relates to the process of cognition in the first place. In the order of the decrease of the degree of concreteness and the increase of the abstractness of forms the trust in the method of interpretation as a procedure or technology of the assessment of the contentfulness of forms is distributed in the following way: first the preference is given to the substituting forms of "empirical experience", then to the practical examples and factual material and further — to the already in advance verified, accepted, and approved in the quality of true abstract (theoretical) constructions and structures.

Why does the factual, concrete material of the thing world (i.e., the form of thingness) dominate in relation to the superstructural, abstract subjectively ideal forms? Firstly, this level of the development of forms is historically primary; the thing forms and the forms of sensations belong to the sphere of the so-called everyday "empirical experience" of man. After all, we walk and run on the earth by no means only and not so much thanks to the mind or intellect, not owing to the presence of abstract thinking and its potential readiness to the construction and comprehension of abstract schemes and models, but in the first place, by virtue of the presence in the general linkage or aggregate of the forms of the "human" nature of the earlier in time of their origin foundation-forming forms-levels — precisely of those forms which are defined as "living", but so far without the accompanying prefixes: thinking, animate, highly organized, intellectual, spiritual, etc. Secondly, in the process of the cognitive activity of man everything unknown and unexplored is always expressed through the already known and comprehended. And since the general process of development (as well as its specific form of a quite definite level — cognition) represents the infinite movement of the contentful constituent through the ever more and more contentful forms-levels, characterized by their uniqueness, unrepeatability, and irreversibility, — it is easily realized that the ***only possible*** way (procedure, algorithm, or technology) of the realization of such a movement-development, as well as of cognition, — this is "***the making of oneself from oneself while changing***" with the reliance on the achieved and with the indispensable use of the contents of the forms of the preceding levels.

Hence, by virtue of the striving to the ever more contentfully capacious abstract forms there naturally takes shape also the hierarchy of the forms-levels, manifesting itself through their branching aggregate (from the thing forms to the forms of thinking). And all this diversity is determined by the unidirectionality of the movement-development (see the formulation of *the principle of self-development*, § 7). In this and consists the sense of the movement in the direction of the irreversible "height": the new content grows out of the available, out of the accumulated, out of the already achieved by way of "the making of oneself from oneself" and simultaneously turns out to be different from itself. [Even a simple external comparison shows that the technology of interpretation as an unalterable element of the cognition of the changing reality turns out to be the embodiment of the same universal *principle of self-development*].

And again let us turn to the verified system of views of dialectical materialism.

"The practical activity of man billions of times had to bring the consciousness of man to the repetition of different logical figures, so that these figures could acquire the significance of axioms" [12, p. 172], — these well-known words of V. I. Lenin give an unambiguous representation of how long a path (in the course of everyday observations and routine actions, contributing to the accumulation of "empirical experience") the true abstract logical constructions, filled with concrete contentful sense (the speech is about the initial forms of sensations and thinking), take shape. Becoming ever more contentful, the mentioned logical figures with time themselves can serve as the foundations or axiomatic basis, as well as the landmarks and indicators of the directionality of the subsequent activity of man, both practical and theoretical. In such an uncomplicated trivial way the multilevel reality is built.

Here I would like to note without fail that the moment of *the latent contentful form-formation* is disclosed by our greatest native dialectician V. I. Lenin so masterfully and conveyed by such a filigree-precise formulation that nothing can be taken away from it or added to it, however much one would like to.

Thus, the ever more abstracting itself in the course of the development of reality contentfulness of its forms indicates at the same time also the perspective direction of the variability of the forms of the representation of this reality. *The maximally achievable (highest) contentfulness — here is the guiding star for all the changing forms on all possible levels of development*. The different logical figures, about which V. I. Lenin speaks, are nothing else but the labor skills, habits, customs, traditions, rites, principles, convictions, ideals, preferences, cultural codes, values, rules, and laws of the behavior of people, taking shape in different human communities over the course of millennia. These are those abstract constructions and structures which, being filled with contentful sense, lead through life from birth to death both the separate individual and the numerous their groupings, not letting them stray

from the path — from the road, in its essence, righteous and true, with the course on the acquisition of the highest contentfulness by the human forms following this road.

Since the sensuous in the multilevel human nature takes the upper hand over the "supersensuous" (mental), the level of thinking (consciousness) tries in a natural and most obvious, primitive way (for the most part, by the "mechanical" path) **to rationalize** everything contentful (especially of the abstract kind), i.e., to express it through quite concrete forms of sensations, which turn out to be for the human consciousness closer, "dearer", and more comprehensible (more thorough) than all the other forms. The technology of interpretation — this is the universal way of the assessment of the contentfulness of all possible forms of reality, but since in our cluster of reality the first-born foundation-forming forms are the thing, material, substantial forms, then in the calculation, in the first place, are taken and the emphasis for the most part is placed on these fundamental "down-to-earth" levels-forms.

In order to establish the truthfulness, reliability, authenticity, actuality of this or that abstract form, it is necessary to reveal and "extract" from the compared abstract and concrete forms the common ("as the one in the many or the likeness of the many" [18, p. 351]) for them content.

The confirmation of the contentfulness of a theory, conception, or any other abstract form is ensured by the realization of the procedure of the comparison of the contents of different concrete forms with the content of the abstract form with the aim of the revelation of the common or coinciding "shares" of the contents of the compared forms and the establishment thereby of the possibility of the replacement (substitution) of the content of the abstract form by the contents of the concrete forms.

In the quality of the common content of all the compared forms there may turn out to be some single universal principle, "mechanism", postulate, or algorithm, common for all the forms engaged in the indicated procedure. In the approximate coincidence of the contents of the forms of sensations and the abstract forms of thinking there is made the conclusion about the contentfulness precisely of the abstract form (since the most interesting for man is the moment of the as large as possible coincidability and succession of the contents of the abstract and thing-sensuous forms). In the opposite case (without the carrying out of the verification of the possibility of the replacement of the contents of the indicated forms), giving free rein to one's subjective abstract fantasies, one can fantasize god knows what. Therefore from time immemorial man is engaged in the search of the criteria for the determination of the truthfulness, in the first place, of the subjective abstract constructions and structures.

The inadequate perception of the world, conditioned by the abstract inventions, false premises, and conclusions, can bring and brings, in the final

result, harm to man and mankind. For this reason man must pay heightened attention to the assessment and verification for contentfulness and reliability of all without exception abstract forms produced in his head, of all human suppositions, hypotheses, inventions, creative ideas, and fantasies (including and especially the publications in the mass media, see § 17). The inaccuracy and negligence in this respect, the excessive credulity to the unverified fabrications brings to man, as well as to the whole of mankind as a whole, immeasurably more harm than the benefit from the momentary gain built on the foundation of false representations and conclusions. The untruthfulness of the abstract forms of thinking means their **low-contentfulness** (i.e., the insufficient filling of these forms with ***objective content***), about which and should testify the non-succession and non-conjugacy of them with the preceding concrete forms of sensations and thingness. Thus, the abstract forms as the products of human thinking — these are the special, specific forms of the representation, *the same thing*, of **the objective content** of reality at the next definite stage of the movement-development of this very reality.

The establishment of the true knowledge about the object is equivalent to the procedure of the mental revelation and "extraction" of *the objective content* from the thing form and the correlation of it with the transformed contents of the more abstracted forms of other levels, namely: the form of sensations and the form of thinking.

It goes without saying that after the transformation into other forms and representations in other forms of other levels, this thing objective content does not remain identical to itself or equal to the content of the forms-carriers of thingness, — otherwise it would not change its form. The changes of the contents accompanying such transformations of the mentioned chain of forms and represent by themselves the peculiarities or the "highlights" of those forms into which the objective content is transformed in the measure of its movement-development or "ascent" from the thing forms. Every subsequent form of the indicated chain includes in itself in the "folded", compressed form the contents of the preceding forms and something else special, different from them — a certain "weight" of novelty and unrepeatability.

The thing form — this is the source and forerunner of the human sensations. However, to compare the content of this form with the content of the form of thinking does not present itself possible, since the content of the form of thingness is not manifestable outside the form of sensations. Consequently, to compare and contrast correctly there always remain only the contents of the forms of thinking and the forms of sensations. The form of thinking must be verified for the possibility and admissibility of the replacement (substitution) of its content by the verified objective content of the form of sensations. Then the form of thinking lays claim to the presence in it of the same *objective content*. Practice, embracing all the diversity of the thing activity of man, including the theoretical devices of the approbation of

knowledge, is the procedure of the verification of the possibility of the replacement (substitution) of the contents of the abstract forms by the contents of the concrete forms of any worth, and in particular and first of all by the content of the form of sensations. However, practice does not embrace such kinds of the verification and establishment of the contentfulness of the abstract forms as the substitution (replacement) of them by the forms also abstract, but of other levels, or by other, already verified abstractions with the confirmed truthfulness. Such a task is solved by the procedure of a more developed character, called interpretation. With the account of this circumstance we have at our disposal the complete set of the instruments or procedures of the establishment and verification of the contentfulness of the abstract constructions and structures of different kinds and levels (storiedness).

As this becomes ever more evident, what is interesting is not the truthfulness of the abstract form in itself (which, it seems, is not the final aim of the human investigations and researches), but the ability of the content of this form to be expressed most completely by means of the contents of the more habitual for man forms of thingness, mediated by the forms of sensations, and the suitability of this content for the further "use". If such is observed, then the found abstract form, pushing apart for man the horizons of the perception and understanding of reality, is built into the general aggregate of the forms, replenishing thereby the contentful accumulations of this aggregate and contributing to the progressive cognition of reality, which "gropes" *simultaneously* by means of man and his thinking the most *optimal* contentful path of its own further development.

The criterion of the truthfulness of the forms — their contentfulness. The truthfulness of the forms is assessed by the presence and "quantity" of this component. The status of the true acquires or obtains the form possessing the highest contentfulness of the possible and achievable at this definite stage of the development of reality. The assessment of the completeness, volume, or "quantity" of the contentfulness of this or that form is carried out by means of the procedure of interpretation (the expression or substitution, at times mental, of the content of the investigated form by the contents of the more concrete forms). The volume, quantity, reliability of the factual material, and indeed of the concrete forms in general, participating in the assessment procedure, and will determine in the final result the completeness of the contentfulness, and hence, also the truthfulness of the investigated form.

Only those newly forming forms "are layered" and "are held" on the summit of the pyramid of the forms of reality which carry in themselves the content conjugating with the objective contents of the forms (constituting the foundation of the pyramid) and continuing by itself the chain of their objective contents. The pyramid of reality acquires stability if it is superstructed by the forms "stuffed" with *objective content*.

The replacement of the abstract forms by the more concrete forms (and more precisely, the replacement of the contents of the abstract forms by the contents of the more concrete forms) answers to the procedure of the filling of the abstract forms with senses or the endowing of them with *objective content*.

By the return "to oneself at a new level" there is carried out the constant refinement of the content of the ever more abstracting summit form of the pyramid by way of the correlation of it with the objective content of the multilevel foundation of this same pyramid.

The assessment of the contentfulness of the theoretical knowledge by practice is equivalent to the procedure of the representation of the content of the abstract forms by the replacing contents of the concrete thing forms, mediated by the forms of sensuousness and sensations (i.e., by the forms of empirical experience).

The truthfulness or reliability of the abstract subjectively ideal forms (i.e., of knowledge: axioms, postulates, assertions, judgments, representations, theories, conceptions, teachings, paradigms, etc.), laying claim to the status of the carriers of *objective content*, is proved not by practice, but by the "quantity" or volume of the contentfulness of these generalizing forms. By the procedures of practice or interpretation there are established the presence and "quantity" of the contentfulness of the investigated forms. The presence of the contentfulness of the forms is determined by the possibility and admissibility of their interpretation by the factual material or concrete examples, and the "quantity" of the contentfulness is assessed by the number of such interpretations. The greater the number of the known concrete examples interpreting the investigated subjectively ideal abstract form, the with greater foundation this form can lay claim to the status of the carrier of *objective content*.

In other words, the process of the search and establishment of truth is reduced to the procedure of the maximally complete expression of the uncognized irrational through the cognized rational (i.e., of the unknown through the known) and the return thereby to one's rational sources or foundations, but already at a new level — with the admixture of something special, as the supplemented rational.

Thus, the criterion of truth is not practice in itself (the thing-practical and theoretical activity of the subject with its results), but the presence and completeness of *the objective content* in the investigated forms, which is established with the help of the procedure of practice or the technology of interpretation.

Correctly generated and reproduced by thinking abstract forms turn out to be more contentful, since they include in themselves in the "removed" or

"folded" (i.e., compact, concentrated) form the data or contentful volumes of a whole multitude of concrete forms.

The presence of a certain common in the particularities and concretions must be confirmed by the as large as possible number of such particularities and concretions. If this condition is fulfilled, then the "extracted" common acquires *the status of objective content*.

After all, what in reality represents by itself this or that theory or conception or some foundation-laying principle which requires either the confirmation and acceptance, or the refutation? This is something common (which someone managed to "spy out" or notice accidentally or deliberately), correctly "extracted" from a certain number of particularities and concretions and concentratedly presented in the form of a generalized abstract theory (conception, model) *for the explanation* and comprehension of the essence of an even greater number of particularities and concretions (both existing and supposed to existence), as well as for *the forecasting* and anticipation of the emergence of the new forms of reality on the basis of the knowledge about this concentrated common.

The truthfulness or reliability of this or that conception (theory, model) is proved by the presence in it of the objective content admitting the interpretation (i.e., the substitution, at least mental) of its content by the contents of the particular and concrete forms (examples, facts). If something abstractly common, constituting the essence of the conception (theory, model), is discovered in the particularities and concretions of the thing world and thereby admits the possibility of the interpretation of it by these particular and concrete forms of the thing world, then this abstractly common is viable and endowed with *objective content*, i.e., is true and reliable.

Such a path of the establishment of truth fits into the single channel of the general contentful movement (from the "incomplete" truth to the ever more embracing and contentful truth), determined by the formulation of *the principle of self-development*. Thus are carried out both the process of cognition, and the processes of the development of anything whatsoever; another path simply does not exist!

Proceeding from the fact that every *just*, *true* theory (conception, model) is interpreted or can be interpreted by the factual material, the admissibility and suitability of the newly advanced conception to the interpretation by the numerous facts serves as the unalterable condition requiring the verification for feasibility in the establishment of its reliability or truthfulness (or at least scientificity). In the channel of this approach this means that the possibility of the effective interpretation of any conception by an infinite number (or at least by a multitude) of facts endows this conception with the status of reliability (truthfulness); in other words, the greater the number of the correctly interpreting this or that theory facts is established, the more

reliable (truer) is the "invented" or generated by thinking theory (conception, model).

As it has already been said earlier, every principle — this is something common, extracted from a whole row of particular separate examples and manifestations. The successful reverse "return" of the common into every new separate concrete particular (if such is possible, admissible, and achievable) and there is the way of the proof of the unity and commonness of the whole row of particularities and concretions, as well as the way of the proof of the presence of *the objective content* in all the investigated forms (i.e., in the compared particularities and concretions).

The general principle (conception, theory) collects and unites by itself the separate particularities and concretions. By the gathering into one of the many particularities is determined the essence of the way of interpretation. If the interpretation (the gathering into one of the many particularities) succeeds, then the found or extracted earlier general principle can be recognized as objectively contentful and presented to the interpretation by an even greater number of particularities. The truthfulness of the principle is established if this principle is just and common in relation to some in advance given multitude of particularities and concretions. The greater the number of particularities and concretions is united by the commonness of the principle, the greater the foundation to consider it *the truth* (true).

The more completely and large-scale the abstract is expressed by means of the concrete, the greater the number of concretions it embraces and unites — the more contentful it is, the more truly it is endowed with *objective content*.

If the form growing by the abstract content does not include in itself the contents of the more concrete forms, is not expressed by them and by their aggregate in the most complete volume, is not substituted (at least mentally) by them, then it is not endowed with *objective content* and, consequently, is not true.

The purpose of the technology of interpretation, in essence, and consists in the verification and proof of the presence of *the objective content* in all possible abstract forms.

§ 14. The differentiation of the forms by the volume of contentfulness. The volume of the contentfulness of a form as the indicator of the approximation to the expression of the objective content of reality

In connection with the fact that the criterion of truth advanced here (that is, the contentfulness of the forms) turns out to be suitable for the quantitative assessment of the forms, it becomes possible to build the diverse forms by rank depending on the completeness or "quantity" of their contentfulness

(truthfulness). Such an approach opposes the myth of the possible equivalence of the different abstract forms (theories, conceptions, models, teachings, plans, etc.), including the identical truthfulness of the different points of view on one and the same question or subject of judgment. The *true* model, assessed as the most "close approximation" to the absolute truth at any given moment of development, — is always one; that is why it is important to be able *to recognize* such a model, in order to rely in one's further perspective movement-development precisely on it.

As in any set (in any aggregate) of the forms of any level, exactly the same way at the level of the subjectively ideal forms there are encountered, in our opinion, both *the less contentful* forms, and *the more contentful* forms (the most "suitable" to the expression of the maximally achievable volume of content at the "summit" levels of the abstracted forms).

Proceeding from such representations, the answer to the question — whether all the abstract constructions and structures, all the judgments (points of view, opinions, positions, decisions, conclusions, inferences, etc. in relation to any subject of judgment) are equal-righted, equal-powered, equal-sized, equal-valued, equivalent, and, finally, adequate, — is expectedly predictable and unambiguous: there is not and cannot be *in principle* equally adequate points of view on one and the same subject of judgment, since any and each of them represents by itself only *the next approximation* to the exhaustive expression of *the objective content* of the subject of judgment (i.e., only *the approximation* to a certain absolute truth). From all the judgments in such a case it is necessary, using for this the most complex criterion of the assessment of the truthfulness of the judgments, to choose the one whose contentful filling is maximal and most close to the expression of *the objective content* of reality (of the objective truth). All the other judgments represent by themselves even more coarse and inexact approximations.

The task of the choice from two and more points of view of the most true or correct one at any moment of the choice will stand before man always, since the freedom of choice, proceeding from the indefiniteness and ambiguity of the course of events and the perspectives of development, with which the subject of cognition encounters and will always encounter, — is *objective* and conditioned by *the dialectical nature* of the world (of the developing reality).
The choice from the row of the approximations of the most "close approximation" to the form of the highest contentfulness will always be the most responsible and dramatic moment in the destinies of mankind and of the separate individuals; and never will this decision be simple. One can only achieve the ever more meaningful striving to the increase of *the contentfulness* of such a decision.

By virtue of the contentful-formal (dialectical) nature of the world and its development and of the resulting from here impossibility of the repetition or *repeated reproduction* of anything whatsoever in details and the smallest

particulars, — there is not and cannot be even two (not to mention a multitude) of equally true, identically equal-sized opinions, judgments, or points of view on one and the same subject (question, problem). One of the points of view (or judgments) will always be closer to the truth than the others. Precisely from this one must proceed, precisely this moment one must take into account in the determination of the truthfulness of this or that form and in the choice thereby of the landmark and foundation for the further investigations and development.

When in application to this or that conception (theory) it is said wholesale that this is only one of the numerous equal-valued points of view or opinions in relation to this or that subject of cognition, one must, firstly, be informed about the *principal* unattainability of the equivalence or equal-valuedness of the different points of view on the subject of investigation and, secondly, remember about the necessity of the following of the certain rules or devices (procedures, technology) of the establishment of the truthfulness of the theoretical forms with the help of the complex criterion of their interpretability (by the verification by the factual material, concrete examples, reliable logical constructions and structures, etc.).

Naturally, few people will believe only on the word in the fact that such-and-such a conception is or can become an alternative knowledge in relation to the existing theories. Only by the presentation of the sufficient volume of the confirming factual material can one convince the interested public (or side) in the fact that this or that approach is at present the most "close approximation" to the true one.

Proceeding from these considerations, one should expect that the special and heightened interest will always be presented by the assessment of the "contentfulnesses" of the above-mentioned forms by way of their comparison and, correspondingly, the determination of their priority by way of the ranking. Since each of the compared and ranked forms is in essence *the next approximation* to the form of the highest contentfulness, about the identity or equivalence of the compared and ranked forms there can be no speech.

All the established, comprehended, and preparing to the comprehension truths — only the next approximations to the exhaustive expression of the content by the most perfect form, the next approximations to the absolute truth. But among these approximations there is always such which represents by itself the most close at any given moment to the "aim" approximation. Precisely it and must be able to find, precisely on it and must one orient oneself in one's investigations and in the adoption of the decisions. This is that present, that actual, that true which acquires the right to the long-term and stable existence, — on which and accentuates the attention G. W. F. Hegel, remarking: "Usually we call truth the agreement of the object with our representation... In the philosophical sense — on the contrary, truth in its abstract expression generally means the agreement of a certain content with itself... The untrue means... the bad, the non-

corresponding to itself... The examination of truth in the sense explained here, in the sense of the agreement with itself, constitutes the genuine task of logic" [3, p. 126—127].

To find such a form which would express the whole fullness of the content of reality at the given moment, i.e., to find the most contentful form, the form of the highest contentfulness, signifying by itself the identity of the components of the relation {content/form}, and, correspondingly, *the degeneration* of the latter into the indivisible wholeness — here is the genuine sense (from the position of our representations), enclosed in the cited words of Hegel.

Truth is always expressed by the form most contentful at any given moment in comparison with all the other competing and accompanying forms. Supposing that the exhaustive expression of the content by the form is possible, admissible, and achievable only in god and through god: "Only God is the true correspondence of the notion and reality" [3, p. 126], — Hegel intuitively clothes the contentful movement of reality and its contentful-formal transformations into the attire of the iteration process of the infinite approximations to the expression of this very "truth in the last instance" (more laconically than Hegel in the light of his representations about this, perhaps, and one cannot say).

In science (as, however, and in life) *the objective* (content) cannot be bypassed without consequences; in the quality of the "given from the age" there is the common, the foundation, the reproducible basis, on which something from the changing and subjective is layered, until this something acquires *the status of the supplemented and developed objective*.

The particularities, peculiarities, and individualities all the same "dance from the stove", push off from the common, on which with time and are layered. The common and objective (content) *takes place* beyond any doubts, and all of us, willingly or unwillingly, strive to see and manifest to the world this *objective content* by means of the different forms.
Everything that is "creative" subjective — this is only the approximations of different degrees (the multilevel models, fragments, or integral pictures), fixed in their striving to the "complete and final" expression and comprehension of the infinite contentful movement, i.e., of the development of this very common, foundation, *objective*. In the context of the considered material philosophy (as, however, and literature, and painting, and music, etc.) — this is the art of *the subjective* to see (discover) and manifest *the objective* (content). For the understandable reasons the successful one here turns out to be the one who manages to do this (such an approach easily and unerringly reveals the true subtext of the depth and greatness, say, of the Russian literature of the XIX century, etc.).

The present approach has as its aim also *to give the representation* of that common, unifying *objective* which so far is not "grasped" by the modern

sciences (the latter, as in the parable with the elephant, each separately see either the legs, or the trunk, or the tail, not having the possibility to make up the representation about the whole). Without the single common ***objective*** foundation neither science, nor philosophy have the chances for the acceleration or the leap in their development.

§ 15. The "winding" of content as the essence of the principle of self-development

What has been set forth in the preceding paragraphs fits into the channel of the concept of development, the main provisions of which and the description of the "mechanism" of the change-movement-development of reality are contained in the works [2, 8, 23].

At any given and arbitrary moment the world is unique and unrepeatable (which has already been noted above). But the unrepeatability or uniqueness of the changing and newly forming forms of reality is possible and realizable only thanks to the "winding", the "making of oneself from oneself", i.e., to the special specific character or way of the movement-development of the forms. This specific peculiarity of the development of reality must never fall out of the field of vision of the analysts engaged in theoretical investigations and the modeling of the changeability of the surrounding world. Under the "dictate" of the algorithm of *the principle of self-development* the correlation of the components-constituents in the known relation {change/basis} constantly changes, as a result of which at every moment there is realized the "*changing basis*", reproducing itself thanks to ever new and new contentful layers, — which is why it does not become exhausted, which is why the very development of reality does not cease.

At every moment the "lived-through" becomes the "building material" for the "coming" present, "winding" and layering onto the still more distant past (the "lived-through"). Only such a way of movement-development as "the making of oneself from oneself", such a course of events, similar to "winding", insures and delivers the future from the detailed repetitions of the past. By the simple "copying" or "reflection" no single process is realized in full measure; the contrary — is from the category of delusions and chimeras. In reality there takes place the permanent movement in the direction of novelty and unrepeatability on the basis of the uniqueness of everything "accomplishing itself". *The very character, type, and way* of the movement-self-development excludes the repeatability and reversibility of the forms.

The appearance of new content in new forms cannot be explained in any way by the "copying" or "reflection" of the external world by the organs of sense (sensations) and by the thinking of the cognizing subject [11, p. 125, 151]. The new content arises and is realized in new forms because it "winds" one layer onto another with the accompanying changes of all the layers (by virtue of the absorption by the layers of these changes) and, correspondingly, with

the differences of the content of the subsequent forms from the content of the preceding ones.

Man, animal, plant breathes, drinks, eats, interacts with the external world, and precisely in such a way — *by the path of the layering of changes onto the basis* — there is carried out the feeding, replenishment, renewal of the developing content of the living forms (including the subjectively ideal forms of human thinking). On the simplest things, on the ordinary and everyday examples one can be convinced of this again and again. In particular, the organism in the state of sleep is precisely that basis, that foundation onto which the changes and new volumes of content accumulated by the organism in the period of its activity are "mounted", into which they are built in. On the example of sleep it is well noticeable that the layers are attached to the basis not evenly and uninterruptedly, but by diverse portions, alternating with pauses, rest, "repose", etc.

In what is seen the "sense" of the life or existence of the plant, animal, man? In that, *by the different levels* of their multilevel formations, to assimilate, express, comprehend the contentful accumulations in the calculation (with anticipation) of the subsequent assimilation, expression, and comprehension of new, still greater volumes of *diverse contentful* accumulations.

Copying and photographing does not give true representations of the current processes in the multilevel reality (including at the level of self-cognition). As reflection or copying this can be perceived and carried out only in immobility, in statics, in the form of a particular case of the universal movement; in dynamics, in development — this is always "winding", "making from oneself"... The development-movement-change of actuality is the generation and embodiment of the objectively realizing *principle of self-development* (***initially*** present in any "something", in any element of reality), which gives the representation and testifies about the intensifying movement of the content (of reality) onto the coverage and comprehension of the very same moving content in its ever more and more "embryonic" state. In the same way there is carried out also the process of cognition as the movement of the specific (gnoseological) form of reality at the level and in the terms of human thinking.

As for the question of the cognizability of the surrounding world, then in the final account it will inevitably be necessary to come to the understanding of the circumstance that the world — this is not a book and all the more not a rock or a boulder-stone in its immutability, but something unceasingly "making itself", reproducing itself, changing itself *in the regime of real time*; and a similar question in a correct formulation must be posed not in relation to the cognizability of something given and existing from the age in its constancy, but in relation to the possibility of *the foresight* and *anticipation* of the newly arising forms (including the consequences, results, events, configurations, situations) of the developing reality.

The levels of development are often inseparable, undetachable from each other for the reason that the contentful constituent, say, of one level can at one and the same time (in interconnection) turn out to be the formal constituent for another level and vice versa. And also for the reason that the contentful constituent of one level necessarily represents a new relation {content/form} for another level. The same thing should be said also about any formal constituent. But the main obstacle on the path of the clear understanding of the course of the process of development and of its exact formulations consists in the fact that the natural boundary between the components-constituents "content" and "form" in their relation is hardly distinguishable, and at times simply not perceptible (for the time being). Thus, the ingrowing of the levels-forms into each other and their growing out of one another is precisely the cause of the impossibility of their separation in a "pure" form, as well as of the intricacy of the processes and of the difficulty of the expression (explanation) of the unexplored, and in some sense irrational, through the comprehended rational.

In such a connection one must always take into account the dual nature of the world, and especially in the cases when the matter concerns the examination and investigation of intricate (and precisely therefore complex) questions. This thought is far from new, we simply often forget about it. And in order to come out onto the correct solution of the fundamental problems, without the dialectical approach it is already in no way possible to get by.

The striving to express the new abstract content through the preceding more concrete forms by virtue of the effect of the winding of content, described and conditioned (the speech is about the effect of winding) by the formulation of *the principle of self-development*, leads to the search of a new form for the new content, which is the continuation of all the other contentful forms present in the linkage or in the aggregate. This form includes in itself in the "sublated", concentrated form the preceding manifestations of the essence of the object and simultaneously is their continuation, expansion, and superstructure with the "inclusions" of some peculiarities (differences) not present until then in the preceding forms. Therefore the main thing that one should catch in this process is not the "reflection" of one in the other (not the doubling or multiplication of essences), but the transformation, the transformation of the available linkage of the preceding forms into a new aggregate form, and moreover not equivalent to the simple sum of the forms, but qualitatively different from it.

The life and existence of man as the subject of cognition — this is the movement of the contentful constituent through the forms-levels in the direction of the acquisition of the most contentful form of such a movement, which is precisely what is affirmed by the formulation of the principle of self-development. In words we, as the embodiment of the predominantly conservative component-constituent of the relation {change/basis}, i.e., of the "basis", of course, can deny that at every moment by each our action, by each breath in and out, by each word and deed (being simultaneously the

personification also of the second component-constituent of the relation, i.e., of the "change") we participate in the search and creation of the most contentful forms of our existence and development; however, in fact everything indicates that there is no alternative to this process.

§ 16. The systematization and refinement of some notions and definitions in the light of our representations about the development and cognition of reality

Let us attempt to systematize what has been set forth above, breaking through, as before, through the veil of delusions and confusion in the notions and representations about the subject of our conversation.

The truthfulness of a form is determined by its contentfulness; hence the criterion of truth or of the truthfulness of the forms is served by their contentfulness. The more contentful the form, the more truthful it is. The internal contentfulness of a form reveals itself by diverse external manifestations, executions, embodiments.

From time immemorial man observes and fixes the multitude of manifestations of the internal contentfulness of the forms, such as: beauty and elegance, simplicity, harmony, laconism, systemicity, economy, non-contradictoriness, self-sufficiency, etc. For the establishment and confirmation of the truthfulness of any form all these manifestations-executions of its contentfulness must pass one and the same procedure of assessment — interpretation, — consisting in the determination of the possibility and admissibility of the substitution of the contents of the investigated forms by the contents of as large as possible a number of concrete and abstract forms, the truthfulness of which has already been confirmed and does not raise doubts.

The matter remains only for the fact that with respect to each concrete manifestation or execution of contentfulness one should find (reveal, select) its own specific standards for the correct determination of the "quantity" of this contentfulness and the expression of it in conventional units. The more such manifestations falling into the field of vision of the human consciousness, the more *complex*, all-embracing, and informative the criterion of the assessment of the truthfulness of the forms turns out to be; in other words, if all the manifestations of contentfulness are gathered together, then there will be obtained *the combined* criterion of the all-round assessment of the truthfulness of any form, — *by the aggregate of the manifestations of the contentfulness* of this form.

Hence, apparently, proceeds also the intuitive striving of a number of researchers to introduce a certain complex criterion of the assessment of truth; the striving itself is quite natural and justified, all the more so that in many fields of human activity, conditioned and generated by the different manifestations of the contentfulness of all possible forms, the criteria of the

assessment of the truthfulness of the forms have already been worked out and exist, in others — they are still to be worked out. But with all the perspectiveness of the indicated idea one should nevertheless stop on the peculiarities of its interpretation and embodiment.

"We suppose, — write the authors, — that the synthesis of the existing conceptions of truth is possible. The core of the general theory of truth can become the conception of correspondence, in connection with the fact that only it discloses the essence of true knowledge. According to the words of Descartes, who clearly and most briefly formulated the main idea of the theory of correspondence, "truth... means the correspondence of the thought to the object". ... Without the correlation with the object the notion of truth has no sense, there is no objectless truth, no truth about nothing" [4, p. 6—7].

On the example of the cited quotation let us examine the confusion in the representations, about which we have declared above. The matter is that in this fragment of the article (as also in the multitude of publications on this theme) there is compared the not quite comparable, similar, say, to the attempt of the establishment of the correspondence between meters and seconds. Despite the fact that both the one and the other "grow" from one root as the components-constituents of the integral relation {time/space}, nevertheless they are not equivalent and not identical to each other, just as the components of the primordial relation {content/form} are not identical and not interchangeable. Here there is evident the attempt to correlate and identify the "formal" and "contentful" beginnings of reality, which by and large is *incorrect* by virtue of their *natural* incompatibility.

The truthfulness of knowledge is determined by its *contentfulness*. The fuller, the higher the contentfulness of knowledge, the more truthful, more reliable it is. As we see, the objectness here is generally beside the point.
The necessity of the "correlation with the object" appears not in connection with the assessment of the truthfulness of knowledge, but in connection with the assessment of the fullness or the "quantity" of its contentfulness, which (the assessment) is carried out, as has been said above, by means of the procedure of practice or the technology of interpretation, i.e., by the comparison and substitution (as complete as possible) of **the content** of the abstract form of knowledge by **the contents** of the more concrete forms of sensations and/or by the contents of the abstract forms of thinking, the truthfulness of which has already been confirmed and does not raise doubts. And only on the basis of the established **contentfulness** of knowledge can one speak about its truthfulness. The truthfulness of this or that form, thus, has no direct relation to objectness (if only for the reason that the confirmations of truthfulness are equally required by both the abstract and the empirical forms or the forms of sensations, closely connected with the thing forms). The truthfulness of the abstract forms is correlated with objectness only indirectly — through the procedure of the assessment and establishment of the fullness of **the contentfulness** of the abstract forms.

For this same reason the verbal turns of speech of the type "the correspondence of the thought to the object" (in the formulation of Descartes) or "the correlation of the notion with the object" (in the modern formulation) from ancient times and up to this day are used **incorrectly** with respect to the procedure of the search of truth or the establishment of the truthfulness of knowledge. One should not forget that the subjective human knowledge about a real object serves as the expression of **the objective content** of the form of the object, **already mediated** by the form of human sensations and by the form of human thinking. Therefore only the contents of the form of sensations and of the form of thinking can be compared, correlated, tested for correspondence. And only on the basis of the revealed (in the process of comparison and correlation) to some extent conjugacy, correspondence, equivalence, or "coincidence" of these contents, only then can one make the conclusion about some commonality and continuity of their forms, and, consequently, about **the objectivity** of the contents of the forms of sensations and thinking, supplementing, deepening, and developing **the objective content** of the form of **the object** itself. By virtue of the indicated circumstance **the objective content of the form of the object** appears already in the quality of **the objective content** of the generalized **multilevel aggregate** (symbiosis) of all the three conjugated successive forms of the different levels (the form of thingness, the form of sensations, and the form of thinking). Finally, **the content** of the above-mentioned aggregate of forms, manifested by means of the form of thinking, with **the objectivity** certified (with the help of the procedure of practice or the technology of interpretation) (i.e., with the highest contentfulness) can lay claim to the status of **true** knowledge about the object.

Thus, *the content* of the abstract form (of knowledge, thought, etc.) requires the "correlation" or "correspondence" not with the object (objectness, being, etc.), but with *the content* of the thing form, and moreover *mediated* by the form of sensations. And already on the basis of the mentioned correlation and the discovered correspondence (correspondence) or continuity of the compared ***contents*** the conclusion is made about the presence in the abstract form of *objective content*, and, consequently, about the truthfulness of the abstract form.

In connection with the remarks expressed here in the address of the fragment of the article [4] I would like nevertheless to note that the article, in our opinion, is still topical, but there are some typical inaccuracies which cannot but be paid attention to in the context of the questions under consideration. Continuing to think straightforwardly and ignoring without exaggeration the leading role and significance of *the content-form relations* in the development (and cognition) of reality, we shall never separate the wheat from the chaff and shall be marking time still unforgivably long. In order to truly penetrate into the essence of any question and to make it out thoroughly, one must consider this question necessarily through *the prism of the content-form transformations* (unfortunately, this appeal so far is a voice

crying in the wilderness). This is all the more necessary for the reason that we live in conditions when the time for the anticipation of the development of events and the correct response reaction to the so-called challenges is catastrophically shrinking. Equally there is no doubt in the fact that the prepared and uncompromising reader will discover in the text of the present article also the inevitable flaws, which would be very good and absolutely normal, for only by the path of the successive approximations can one approach the ever more exact and "exhaustive" expression of the objective (true) content of the developing reality.

Further one should necessarily once again emphasize that, despite the difference of the external manifestations of the contentfulness of the forms, the technology (or procedure, or way) of the assessment of the truthfulness of any forms remains universal and standard — this is interpretation, the particular case of which is practice. This technology consists in the revelation of the possibility and admissibility of the substitution of the contents of the investigated forms by the contents of as large as possible a number of concrete and abstract forms (with the already established and confirmed truthfulness); i.e., the technology of interpretation is reduced in the final account to the search or working out of the so-called standards or conventional units, by means of which one can express or present the "quantity" or the fullness of the assessed contentfulness of the investigated forms.

The essence of this technology is always one — the expression of the unknown through the known, of the unusual through the habitual, of the uncognized through the cognized, of the incomprehensible through the comprehended, of the irrational through the rational, of the indefinite through the definite, of the more abstract and less concrete through the less abstract and more concrete, etc., etc. Everything uncognized and unexplored is assessed, tested, and expressed through the already available and existing, the truthfulness of which is established and tested by time. Nothing new here neither man nor nature will be able to "invent" any more, since both the process of development (of anything whatsoever) and the process of cognition (of anything whatsoever) have always submitted, submit, and will submit to the universal principle of self-development. *Herewith it has no essential significance whether the particular is expressed through the general or vice versa, — the main thing is that as the result of the described procedure everything until then unexplored and indefinite acquires a more or less finished (balanced for the time being) form of something tested, proved, achieved, and comprehended.* However, there are also other points of view [9].

The impossibility to wholly or all-embracingly and exhaustively cover the "making and developing" by the existing and achieved both conditions and generates the approximateness, inexactness or, so to say, the "chronic" unfinishedness of the expression or coverage of the content by the form in the course of the interaction of these two constituents. There necessarily

remains something contentful (or some its share), uncovered and *not yielding* to the coverage by any form, with whatever "zeal" the latter would lay claim to the very perfection. The spiral, as also the comma — this is a circle "with development" or a point "with a tail", foretelling always a new turn of events and a step into the insufficiently definite and not fully explored.

It is also necessary to note that with the described approach to the assessment and establishment of truth or the truthfulness of the different forms of knowledge it has no significance whatsoever — whether this is humanitarian knowledge (from the field of literature, journalism, politics, art, etc.) or natural-scientific (technical, physical, mathematical, etc.), since falsehood and falsity are *objective* categories, the essence of which consists in **the low contentfulness** (and, consequently, in the untruthfulness) of the contents of their forms, which one way or another, sooner or later will be refuted and rejected by *the principle of self-development*, indicating the objective movement-striving to the highest contentfulness (and hence, also to the truthfulness) of all without exception the developing forms. The sooner man realizes this, the farther from the edge of the abyss (i.e., from the threat of the disappearance of humanity as a definite level-form of reality) he will (re)move.

Thus, the truthfulness of any form is determined by its contentfulness; *the most truthful are the forms **possessing** the highest contentfulness*.

Proceeding from this, the criterion of the truthfulness of the forms is served by their contentfulness, whereas practice or in the broader sense interpretation — this is only the universal technology, procedure, or way of the assessment of the fullness or the "quantity" of the contentfulness of the investigated forms.

If one unites just what has been said into one phrase, then there will be obtained such a more or less compact expression: the criterion of truth or of the truthfulness of the investigated forms — this is the contentfulness of these forms, the fullness or the "quantity" of which is established by the possibility and admissibility of the substitution (at least mental) of the contents of the investigated forms by the contents of *as large as possible* (in the limit — *infinite*) a number of concrete and abstract forms *with the already established and confirmed truthfulness*.

With respect to the determination of the criterion of the scientificity of knowledge (i.e., of the objectivity of the content of the abstract forms of knowledge) one can say the following.

The criterion of the scientificity of knowledge (or the criterion of the objectivity of the content of the abstract forms of knowledge) — this is again the contentfulness of these forms, the fullness or the "quantity" of which is established by the possibility and admissibility of the substitution (at least

mental) of the contents of the abstract forms by the contents of a certain *conditionally-limited number* of concrete and abstract forms *with the already established and confirmed truthfulness*.

From the position of our approach the main functions of science — the explanatory and the prognostic — can be approximately determined and characterized in the following way.

Explanation — this is the interpretation (expression, substitution, replacement) of the contents of the unknown, incomprehensible, unusual, non-standard abstract forms (judgments, constructions, structures, theories, conceptions, formulas, etc.) by the contents of the known concrete, comprehensible, habitual, standard forms.

Forecasting — this is the anticipation of the formation, appearance, or discovery of the new forms of reality (as well as the foretelling of the direction of the changes of the existing its forms) with the help of and on the basis of the "invented", generated, created, formulated generalized abstract forms (judgments, theories, conceptions, hypotheses, constructions, structures, formulas, etc.), the objectivity of the contents (i.e., the contentfulness) of which either has already been established and confirmed, or is in the stage of the assessment and confirmation by the technology of interpretation.

The very important criteria of the scientificity of knowledge — the reproducibility and repeatability of the results of the empirical investigations — in the terms of our approach mean the admissibility of the multiple interpretation (expression, substitution, replacement) with the identical result of the contents of the investigated empirical forms by the contents of the similar empirical forms, the truthfulness of which has already been established and does not raise doubts.

The logic of the exposition of the research approach expounded here requires also the corresponding interpretation and refinement of the term "adequacy" from the position of our representations about the development and cognition.

And again we "dance from the stove". The philosophical dictionaries determine adequacy in the following way: "In the theory of cognition the term 'adequate' serves for the designation of the correct reproduction in the representations, notions, and judgments of the objective connections and relations of actuality. In this sense **truth** is determined as **the adequacy of thinking to being**" [19, p. 13].

By this definition we are again attempted to be convinced of the correctness of the comparison of the incomparable and the comparison of the incomparable. Contrary to the cited definition, adequacy has no direct relation to being, just as truth has no direct relation to objectness (as has

been indicated above). *The adequacy* of thinking in the given case means the high *contentfulness* of the forms-products of this very thinking, which has already passed the assessment or test by interpretation, as a result of which the mentioned forms-products are recognized as *true*.

Thereby the term *adequate* designates and characterizes **the content** of the *true* form of thinking, maximally corresponding (i.e., successive and continuing by itself) to **the objective content** of the form of thingness (or to the objective content of being), *mediated by the form of sensations*.

And truth, as has been determined earlier, — this is the form (but the form as the aggregate of the forms of thingness, sensations, and thinking), fulfilled with the highest (objective) contentfulness.

And the one and the other — deeply interconnected notions. The inadequate thinking, operating with the content of the untrue forms, is punished by "non-being" ahead of time and prematurely.

The adequate notion, the adequate image, the adequate representation, the adequate theory, the adequate doctrine, etc. — this is all about *the objective content* of the diverse *true* abstract forms-products of thinking.

As we see, the term "*adequate*" is applicable only for the assessment, designation, and statement of the fullness of the contentfulness of the uppermost layer or the summit of the pyramid (i.e., of the human consciousness), in the foundation of which lie the more primitive material-thing and plant-animal levels; at the same time, one should clearly realize that without the linkage and interengagement with these more "down-to-earth" fundamental levels that "summit" level of the human consciousness simply does not exist.

The adequate thinking — this is the thinking operating with the content of the *true* forms (the most contentful abstract constructions and structures), tested for the fullness of contentfulness by the procedure (technology) of interpretation. The latter means that the highest contentfulness (and hence, also the truthfulness) of such forms has already been confirmed and certified by the numerous concrete examples and factual material (including the abstract forms tested and approved for the use).

The inadequacy of thinking is punished by the premature (early) termination of the development of the form of man and humanity (by the retardation of development, the "tearing apart" of the form into parts, the absorption and assimilation by the competitors). One of the signs of the inadequacy of the thinking of the modern man is the neglect of dialectics.

The regress of a form — this is already the indicator that it is "torn apart", both from within and from without, into parts by the other, more active

levels. The form that has stopped in its development is "picked up" by the neighboring levels, assimilated (wholly or in parts) and acquires thereby a new impulse for its own further development.

Integrally, harmoniously, capably, effectively, actually, and truly is that which is filled with *objective content*, which is the most contentful at the given moment and under the given circumstances.

The continuity of the forms presupposes the smooth docking, the smooth ingrowing, the smooth transition from the contents of the forms of the thing-practical level to the contents of the forms-products of the level of thinking (which are the abstract representations and images).
However, the determining here all the same, in the final account, turns out to be *the objective content* of the thing-practical activity, i.e., the contents of the forms of the thing level (mediated by the forms of sensations), since they are more fundamental in the *multilevel* structures of the forms of man and humanity.

The abstract forms-products of the subjective thinking (i.e., knowledge in the form of representations, images, notions, theories, doctrines, etc.) and the more concrete forms preceding them are capable of being built and are built into the non-contradictory-successive sequence or chain of forms only then, when they are endowed with *objective content*, when they are united by the common component, which is *the objective content* of the developing reality. In the indicated sense *the objective content* of the developing reality — this is the identity to the infinite movement to the exhaustive expression of the content of reality by the developing forms of this very same reality.

In its turn, the highest contentfulness of knowledge and of its forms (i.e., the filledness of the abstract forms with *objective content*) and, correspondingly, *the adequacy* of the perception of reality (the approximate, but as complete as possible coincidence or correspondence of *the contents* of the abstract forms of thinking and of the forms of sensations) ensure the success of the human activity and serve as the condition of the survival and stable development of humanity.

In the modern literature (and all the more in the publications of the past) the notion of *adequacy* is very weakly, or more precisely, practically in no way tied up with *the contentfulness* of the forms. Meanwhile the solution of the task of the establishment and detailing of such a connection will inevitably lead to the numerous discoveries in the field of medicine, biology, cybernetics, and other spheres of the scientific activity. With respect to man *the contentfulness* in the face of such manifestations of the organism as health, longevity, adaptation abilities and possibilities, resource, intellect, etc., must be investigated in the closest interconnection with *the adequacy* of the thinking, perception, behavior of man (and of the other higher representatives of the animal world), if the researcher is set on the obtaining of the original (breakthrough) results in the course of his investigations.

§ 17. The truth about lies

The present section is devoted to the illustration of the material set forth above by some concrete examples and considerations.

As has already been noted in § 3, the modern mass media, controlled by the collective West, are devoid of doubts as to the "exceptional" justice of their endless attempts to attain unseemly goals by deliberate injections of false information, by force pressure, and by the manipulation of the consciousness of the man in the street, and by all possible means to push through the superiority of their own contentfulness, i.e., of their own "unsurpassed" understanding of truth or verity, mixed with false premises and foundations.

In confirmation of what has been said let us cite the frankly cynical opinion on this score (in an article with the derisive title "The Rabies of Russia") of one of the modern propagandists of such opinions, who has "settled" on the screens of Russian TV:

"... Recently we saw the manifestation of the American 'right of the strong' in all its glory — the murder of the Iranian general Qasem Soleimani.

... Yes, such an application of the 'right of the strong' is outrageous, dishonest, and often unlawful. ... But the fact remains a fact: the 'right of the strong' is an inevitable, even natural, I would say, part of world politics. Whether anyone likes it or not, one must accept such a phenomenon as a given. Similar to the Darwinian natural selection, the 'international order' has existed from time immemorial, and so it will always be to one degree or another. The right of the strong — this is one of the most vivid and harsh manifestations of 'realpolitik'" [1].

From time immemorial the Anglo-Saxon world has been consistent in its main goals — to impose its own scenario of the development of events contrary to their objective course and adequate perception. The Anglo-Saxons are obsessed with the belief that by a simple "wishing", by pressing, by the inculcation of a certain oversimplification (i.e., by the refusal to take into account the multitude of interacting factors) one can artificially break the naturally developing contentful process. By their standards, the thing-object-material in its monetary expression will always prevail and overcome everything else.

For the assessment of the weight and authority of the position occupied in the cited article one must answer a simple question: is the contentfulness of the theory of "social Darwinism" high at the present stage of development? Undoubtedly, something "long-playing" remains from this theory to this very day (man, for example, will never *fully* free himself from the animal principle present in him, if only because he has "come out" of this principle). At the same time, any schoolboy today knows that "wild" nature is represented by

only a narrow stratum, an intermediate level in the universal human nature, alongside a whole series of newly superstructured levels, based on the taking into account of such qualities of the developed man as his dignity, readiness for cooperation and mutual aid, humanism, etc. Undoubtedly, the level of "wildness" is also represented in the linkage of all the other levels of the multilevel structure of man and at times *tramples* under itself the less aggressive by their nature "intellectual" ("herbivorous") levels, but it is also beyond doubt that its specific weight in the general aggregate of levels at the present stage of development is considerably smaller than in the epoch of Ch. Darwin. And to reduce the whole objective contentfulness of the existing linkage-aggregate of levels in the general structure of the modern man and his thinking to this separate, very "down-to-earth" ("carnivorous") level — this is a simple-minded delusion or a deliberate lie.

The justice of this point of view is confirmed by the centuries-old wisdom of our people (or by the somewhat paraphrased saying of Alexander Nevsky): not in force is god (victory, success, perspective, goal, etc.), but in truth, in verity ...

But to the above-named cohort of people with colonial thinking this cannot be explained. The speech is about people not simply of another discourse and not even of another civilizational order, but about "offspring" and exponents of *another (opposite) principle of reality*, with whom to speak about the priority of harmony or of the objectively existing tendency to the achievement of a certain balance of the constituents-levels in the multilevel human nature is so far meaningless. They are convinced that the hypertrophied technological constituent in their state structure guarantees them complete success and victory over the whole world. What nonsense! On this soil they absolutize their significance and greatness; in reality, however, they are sick with their imaginary exclusivity and see nothing further than their own nose. All the more problematic for themselves. *The low-contentful* (primitive) consciousness has a chance never to reach the critically necessary level and to turn out to be *a dead-end branch of the development of humanity*: gentlemen Neanderthals, where are you? Hello!

Fortunately or unfortunately, but the objective truth exists; at any given moment it is **one** (out of the multitude of similar approximations to the absolute truth), and ever more insistently the requirement to determine oneself with this question "in an adult way" shows through. The neglect of the objective truth is fraught with the loss of humanity as a species or as one of the levels of reality; at stake is the fate of humanity, no more and no less.

The main stake of today's "masters of life" and of the mass media subject to them — on the low "down-to-earth" instincts of man, i.e., on his "dehumanization": the accent is made on the stimulation and increase of the contentfulness of only the most primitive forms-levels (in the composition of the whole aggregate of the levels-constituents of the modern man), and, in particular, of the simplest forms of sensations and behavioral reactions of the

animal level. The artless content of the indicated forms is "sewn" into the brain of man by repeated hammering as axioms (the so-called unproved truths). The main mass of undemanding philistine minds, by virtue of their ignorance, "falls for" the cheap installation and propaganda of following the imposed way and mode of life. The capitalist world, saturated through and through with lies, hypocrisy, double standards, simply does not know how to live otherwise (i.e., without taking "cream" under cover). And as for the mass media, they always take the position of the one from whose hands they are fed, which by no means testifies in favor of their independence; the mass media are still "party", as they were a hundred and two hundred years ago. The question of the purification of today's mass media from the filth of lies and half-truths is not solvable, apparently, outside the clarification of the personal positions of the representatives of these mass media. This question must be posed approximately in this way: will you be able, are you *vouchsafed* personally, as a subject form (as a journalist, correspondent, commentator, political scientist, etc.), to be a form-carrier and continuer of the developing *objective content* in opposition to the "fake", lying, venal subject forms that are present and rooted here today? Of course, this question makes sense only in conjunction with the solution of the problem of the proper upbringing of young cadres. Journalistic cadres, like medical ones, must be brought to an oath or a certain vow, proceeding from the understanding — of how serious a weapon against humanity the propagandized lies and inadequacy of thinking can be.

The collective West, in the person of the overseas "hegemon" and its henchmen, has in fact already "played out" to the conviction that no *objective content*, no truth or verity exists *in principle*; everything is exhausted by *general validity* and by what can be imposed on the undemanding majority by the manipulation of human consciousness and by frankly force pressure. The manipulation of the consciousness of man — this is a crime against the person and against humanity. And the deliberate lie, and the sincere delusion, and all the more the manipulation of consciousness — are equally ruinous for the fates of humanity.

The Western mass media seriously discuss the question of the onset of the epoch of the so-called "post-truth". The "post-truth" of an infinite number of subjective opinions and utterances (fictions, hardly distinguishable from truth; unfounded assertions, "appointed" to be truth; retold rumors and idle conjectures) must be urgently refuted by the proof of the absence of a stable direct and reverse connection, of succession and conjugacy of the contents of the injected subjective abstract forms with the objective content of the thing reality, of concrete facts, of reliably verified abstract logical forms with confirmed truthfulness.

One cannot arbitrarily and unceremoniously deal with truth (with verity), and not because it is punishable by a certain "supreme deity" or "providence", but because the world is arranged dialectically. The return to the initially rejected forms of greater contentfulness will take place sooner or later, and

all the false, momentarily advantageous orientations together with their propagandists and customers will be rejected and overthrown. Such is the dialectical nature of the world, implying the inevitable return to itself, but every time at a more and more contentful (genuine, true, actual) level. The universal *principle of self-development* "governs" everything and everyone, manages all processes without exception, and so simply, on any crooked goat, it can no longer be bypassed. Everyone is free to choose himself — to accept this principle and follow it in life, or to deny and ignore it with the inevitable consequences for himself.

The real state of affairs is such that, by virtue of this very *dialectical nature* of the surrounding world, everything sooner or later has the habit of returning "to the starting point", but not in its former form, but in other, more weighty and more contentful forms. In case of non-understanding or ignoring of such a layout, or in case of unskillful and imprudent dealing with the mentioned renewed forms — the impacts, and even the blows of these "weighted" returning forms may fall not where it is below the belt, but where it is above the neck.

The growing contentlessness of the collective West will ruin it. And this will happen not by reason of God's punishment, God's providence, or the execution of a certain "law of karma", but because the exhausting contentfulness of their main everyday forms (of the way of life), based on human vices, provokes the absorption of these forms by considerably more contentful stable forms. Too many empty (low-contentful) form-formations at all levels have been generated by their mercantile aim and rampant individualism (sham post-industrial "economies"; the unsecuredness of the Fed currency; lying mass media; fruitless same-sex marriages; pretentious idle celebrations; the perverted "post-truth" "appointed as truth"; ostentatious values; pharisaical juvenile justice; the hypocritical multiculturalism, tolerance, political correctness that appeared out of nowhere, etc.). When a society (or a state) pursues *low-contentful* goals, then it is absorbed *by more contentful and balanced social arrangements*.

The form-formations enumerated above (in parentheses) belong to abstract constructions and structures, invented by an extremely subjectivized consciousness and erected on shaky (false) unnatural foundations. These constructions and structures, generated by the subjective imagination in the minds of a few individuals, do not belong to the number of those tested by time and confirmed by customs and traditions, but have in their arsenal only a limited number of more or less successfully realized examples. Here we directly encounter the manifestation of voluntarism, with the arbitrary absolutization of the subjective component in the known systemic relation {subjective/objective}, which is fraught with the violation of the balance or equilibrium of the whole relation as a whole. Too small a volume of factual material is at the disposal of man to verify and confirm the truthfulness of the abstract constructions of the indicated type and to admit them then as

new foundations for mass application by humanity. Without a thorough assessment of the contentfulness of the fruits of the inflamed brain and unbridled fantasies by the procedures of practice and interpretation, the truthfulness of these forms, to put it mildly, raises doubts, and the stubborn universal inculcation — is certainly dangerous.

In every relation similar to the relation {change/basis}, a typical representative of which is also the relation {subjective/objective} examined by us, there is present *a definite correlation* of the components "change" and "basis" in their relation, guaranteeing the stability and steady development of the relation itself as a whole at one or another stage of the development of reality. The finding of such a correlation of the components-constituents in the indicated relations, corresponding to a certain averaged *balanced* value, determined and conditioned by every given stage of the development of reality, always has been and will be the most important priority task standing both before individual subjects and before their communities.

As soon as the immature subjective thinking begins to ignore its connection with the "down-to-earth" levels of *the basis*, so it goes into an extreme, into a one-sidedness, into the absolutization of this one-sidedness. Thinking speculatively and practically boundlessly can manipulate everything whatsoever, which it does, and obtains any "results", and achieves "outstanding" successes. But much of these "achievements" is acquired at the price of the loss of the adequacy of the representations about reality. And in this case the individual or community, recklessly and "crazy-headedly" using the huge potential of thinking (characterized by the high intensity of content-form transformations), fall into a trap.

Quite in the spirit of the Anglo-Saxon subjectivized tradition — by force to drive into "paradise" and to "cultivate" (civilize, democratize, etc.) all the disagreeing and resisting. Such, from time to time repeated, neglect of the objectively taking-shape situation will inevitably return to the Anglo-Saxons as a boomerang of punishments for their new generations, which will have to "reverse gear", paying for *the inadequacy* and *low-contentfulness* of their ancestors. Unfortunately, the majority (and, first of all, the youth) does not see this yet, naively believing that the technocratic policy and technological "advancement" will automatically ensure primacy and advantage in all spheres of human activity. In reality, however, the ugly one-sidedness or imbalance in the development of different sides-constituents of individual civilizations leads the latter to degeneration into their opposite and to inevitable collapse. [As a result of the excessive rocking or loss of equilibrium, the "ship of civilization", speaking figuratively, capsizes upside down, i.e., the situation turns into its opposite: in the place where man was (the so-called crown of nature, according to the very widespread opinion nowadays), there turns out to be a bottom soaked with tar, and the crown of nature is swallowed by the abyss, i.e., returns into the wild (thing) nature and is assimilated by it.]

After all, what mainly distinguishes the modern Western ideology from the Eastern one (in particular, within the framework of the antagonism USA vs Russia)? These are different representations about the necessary and sufficient correlation of the components in the relation {change/basis} (or in the most general relation {content/form}). The Western world makes the accent on the prevalence of the constituent of *change* (transcendent enterprise, infinite freedom, unlimited individualism and egoism, etc.), whereas the East gives preference to the component of *the basis* — stability, experience, common sense, justified conservatism, collectivism. And already from here, on the part of the West, follows the neglect of morality, ethics, humanism. Here two different approaches meet and compete, relying on different specific weights (including in digital expression) of the above-mentioned components-constituents in their inseparable integrity. For the finding of the balance or the golden mean between the indicated components, of course, both a reserve of patience and an ever more meaningful loyalty of the West and the East with respect to each other are needed. However, no less significant is also the understanding that at times it is simply necessary to *actively* counteract aggression (both in the air, and at sea, and on land, and, especially, in space). In the trenches, alternately turning the cheeks for blows, one cannot sit out. One should more boldly and energetically bloc with like-minded people and by collective efforts control the balance of the system {West/East}. In particular, all the "iron" of opaque and doubtful purpose, launched into space by the "hegemon", must find its rest at the bottom of the world ocean.
There must be no illusions; one cannot fail to see that in this case the West represents *not so much an active as an aggressive* component of the relation {change/basis}, opposing the moderately-active component of the East. The West is "commanded" by a quite different *principle of reality* than the East, and the full compatibility or *coincidence of both principles is not achievable in principle*. That is why the unsafe algorithms "swarming" in the heads of the collective West must be neutralized at the earliest stages. The known inadequacy of a monkey with a grenade can lead to the collapse of the whole system {West/East} and to the departure "into non-being" of such a form-level of reality as humanity. It goes without saying that the development of reality and the natural universal course of events under the "control" of the principle of self-development cannot be stopped by this single act — simply a separate link in the general chain of development will be transformed into a new form, which will continue its contentful movement at a new level, but already without man. However, to man himself his fate, perhaps, is not so indifferent.

The procedure of finding the balance of the above-mentioned components-constituents is complicated also by the fact that the components are subject to the permanent influence of numerous external and internal factors (i.e., of the same components of other relations), which makes them very mobile within the framework of a single relation and, in its turn, leads to the sporadic variability of the relation itself as a whole.

Changes without a basis (i.e., the denial and reduction to a minimum of the significance and role of the basis) in the known relation {change/basis} — this is absurd. The basis directs the changes, preserves them in the form of layers and thereby sets the vector of the subsequent changes (i.e., of development). The changes that become isolated and "tear away" from the basis liquidate the relation as a whole as such, since something, being deprived of the basis and "not remembering kinship", is transformed into its opposite. The vector of development is to a considerable degree determined by the basis, i.e., by the past, by the "lived-through", by the preceding accumulations.

The role of Russia as the main stabilizing component or counterbalance in the system {West/East}, threatening at times to go to pieces, — is indisputable. True, the most effectively this counterbalance will function only on the basis of the renewed social structure with the socialist order, which, undoubtedly, is *our national priority and pride for centuries*.

The absence (especially among politicians) of adherence to such, for example, qualities of man and indicators of the developed harmonious society as honor, conscience, decency, morality, ethics, philanthropy, mutual respect — is a direct path "into non-being" for those human communities which refuse such humanistic acquisitions, ideals, and convictions.

The inadequate behavior of the majority of individuals (of society), as a reaction to the movement into nowhere, "sanctified" by *contentless* goals, is punished by "non-being", i.e., by the absorption and assimilation of the low-contentful forms by the healthy *adequate* forms. Russia, with its considerably more adequate than that of the collective West representations about reality, has every chance for leadership with a humanistic orientation, provided that a way is found to transform the ugly and defective capitalist forms imposed on it into other harmonious forms of development.

As time and the course of the developing events show, the subjective, it would seem, question of *the justice* of the social structure [Roman law, for example, refers the notion of justice to the subjective categories] turns out to be a question not at all subjective, but exclusively objective. Taking into account the striving and craving for justice originally inherent in our people, the following ideological scheme or chain of contentful transformations has quite matured for embodiment at a new level: truth (verity) => justice =>law =>equality => (social) equilibrium =>balance =>harmony ... Any human community or civilization in one way or another (explicitly and implicitly) strives for the realization of such a chain, conditioned **by the dialectical nature of the surrounding world**. In reality — this is a question of life and death for all the human communities presently existing.

It is worth, perhaps, to dwell separately on the role and significance of modern advertising.

Today's aggressive advertising on TV — this is, as a rule, well-paid lie and deliberately distorted representation of the true state of affairs. In the language of advertising, from the tenderest nails, a signal is sent to man: one can lie a lot and with impunity, from a high tribune and to a multi-million audience. Advertising almost always peremptorily hypertrophies the limited positive and advantage of the goods, services, and all sorts of "brands", hiding in the backyard their negative features and shortcomings. In this consists its lie, by this it perniciously influences the unformed young minds. The lying advertising from morning till evening teaches the youth also to treat easily and undemandingly their own unfulfilled promises and empty assurances.

Advertising must be removed from TV unambiguously. The most "creative" liars cry out that without advertising there will be no TV. They lie, shamelessly lie, for the principles of the functioning of TV are deliberately distorted and disfigured by the dealers from TV. Those lie who have a relation to the huge money that revolves in this backstage and that can be uncontrollably stuffed into pockets. In the conditions of the social character of production and the private-capitalist mode of appropriation, the throwing of dust in the eyes of the respectable public — is an inalienable element of all television shows and attractions. When the matter concerns the distribution and appropriation of the product worked out under capitalism, everyone must immediately forget about the transparency of these procedures — otherwise by no forces will it be possible to gather on relatively tiny patches the transcendent number of crooks and other odious individuals.

Meanwhile, the way around these "naturally" organized difficulties is quite well-known and artless — to create an accumulation fund, public consumption funds and *to feed* with them the vital and demanded directions, and not only on TV; this is, perhaps, so far the most effective and tested way of the development of human initiatives in the conditions of the coming socialist order.

Let us touch upon the background of the origin and rooting of false premises.

A lie — this is also a certain contentful form, but with an extremely low degree of *objective contentfulness*, i.e., a form of a very distant (rough) approximation to the expression of the objective content of reality (*a low-contentful*, and therefore *untruthful* form).

A shameless lie — this is a factual refusal of the moral-ethical norms and categories in favor of a temporary, momentary, as a rule, material gain (with its single measure — the volume of the money supply). To such a choice is brought by the cultivation of the vividly expressed individualism in opposition to collectivism and the priority of public interests.

The inability and unwillingness to distinguish the inessential or little-essential from the essential, firstly, and the arbitrary absolutization of this little-

essential to the detriment of the essential, secondly, — is akin to an impudent shameless lie. Using such a device one can for a long time effectively make mountains out of molehills, deliberately belittling the contentfulness of the essential forms. The conscious belittling of the essential and the exaltation of the inessential is equivalent to the mixing of lie with half-truth, and therefore this is the most refined, vile, and disgusting variety of lie. However, sooner or later the natural installation on the growth of the contentfulness of the forms will take its toll and will arrange the forms in their places according to the level of their contentfulness.

Every lie — this is a deliberate attempt to lead aside and to evade the adequate thinking.

When we are tried to be convinced that black is white, referring to the truthfulness of *the generally valid* (i.e., to the opinion of a certain "little collective" that has gathered under its banners a limited number of individuals), then these propagandists of the generally valid *to the detriment of the objective* must bear in mind that the answer for the imposition of a failed opinion may, as it may turn out, have to be held not before the hoodwinked "little collective", but before the deceived humanity.

Virtual reality — this is a lie based on the unsupported and unconfirmed by the content of concrete forms *admissibility of the prevalence of the subjective* constituent in the relation {subjective/objective} to the detriment of *the objective* constituent. The modern cinematography of the "overseas" Hollywood type (which has splendidly mastered the "Solzhenitsyn" motives and devices of inflating the less essential to scales surpassing everything essential) is saturated with fictions, tricks, and special effects, hindering the adequate perception of reality. The indulgence of the "overseas" *inadequacy* again is fraught with consequences for the whole world.

In the final account, this is the right of every individual to choose — in which direction and to what extent one should shift the dividing line in the relation {subjective/objective}, but, fortunately, the criterion of the correctness and admissibility of such "shifts" nevertheless exists; this is the adequacy of the content of thinking to the content of being. In the case of the absolutization of the component "subjective", the harmless, at first glance, inadequacy of thinking and of the formed representations about reality can lead to serious consequences. The above-mentioned "little collective" or a certain limited community and its collective consciousness is capable of existing in the "fake" regime of the inadequate perception of reality only for a very limited time as well, but even in a short period it can create a global threat to the survival of humanity as a whole, and even destroy it ...

Let us cite a somewhat hyperbolized and therefore quite obvious for comprehension example. Suppose, from the apartment of the seventh floor there are two exits outside: through the door and through the window. Everyone knows that one can go out both through the door and through the

window, but the overwhelming majority habitually uses the door, since it knows that the exit through the window is fraught with grave consequences. And nevertheless there are separate individuals who, following obsessive ideas, leave the apartment through the window, and for one reason or another their number will never be reduced to zero. The realization of such an alternative possibility on the scale of the whole humanity would threaten the disappearance of humanity as a species. The loss of the adequacy of the representations about reality in this case could turn out to be *critical* and be expressed in the loss of humanity as a definite level of reality. The speech here is precisely about such a "*can*" which "*cannot*" from the point of view of the adequately thinking man (and of humanity as a whole). [Deliberately exaggerated examples sometimes help to feel the real danger of flirting with *inadequacy*].

Another example. The Ptolemaic picture of the world proceeded from the primacy of the geocentric representations. Was this inadequacy of representations critical for those times? Probably, no. But with time, little by little, it became such. In any case, no accuracy of the calculation of the trajectory of the flight of space vehicles on the basis of the Ptolemaic model (because of the transcendent *cumbersomeness* and error of the calculations) could be out of the question today.

Thinking easily shifts the boundary in the relation {subjective/objective} in the direction of the prevalence of the subjective (for itself, as for the most abstracted level of reality, this is not critical), but at the same time it can, to the detriment of adequacy, provoke the "exit" of the values of the whole relation beyond the limits of the range admissible by this definite stage of development. In other words, for "proper" thinking some inadequate preferences and unbridled internal activity (while they are localized in the head, without exit outside) can remain and without consequences, but for the whole linkage-aggregate of the levels of man (dwelling in the thing world and including in itself the form of thingness, the form of sensations, and the form of thinking) — the arbitrary choice of thinking with the subsequent exit of the inadequate reactions outside can turn out to be *critical*, which is shown by the examples cited above.

A lie is often dictated by the striving to adapt to the external conditions and influences in the name of the survival and prosperity of some separate form-level in isolation from the remaining levels of the general aggregate in the composition of the structure of man (say, the exaltation of the flesh and material acquisitions to the detriment or bypass of morality and ethics). At the same time, at the mental level there "reigns" a factual "dual power" (split): something more formal collides with something more contentful. As a result, a conflict arises: the contentful constituent "supervises", as a rule, directly the straightforward, artless path of the achievement of the goal; the formal constituent, however, for the sake of the achievement of the goal, as it seems, by a more sure-fire path, is ready to go roundabout, i.e., to lie.

Truth and lie — forms of deliberately different degrees of approximation to the expression of the fullness of the moving (objective) content. By virtue of the perniciousness of the influence of even the smallest public "fakes" and fictions on the minds and consciousness of people, one must fight against lie harshly, resolutely, and mercilessly — to suppress, not leaving without attention a single serious attempt of the rooting of falsity. When the question arises about the survival of humanity or of its separate communities, the orientation to the inadequate thinking, false premises, and "values" not approved by life is categorically inadmissible.

In order not to find oneself on the sidelines of development, *the contentfulness* of all without exception forms (ideas, perspective plans, projects, programs, directions, etc.) planned on the state scale for development and embodiment must be analyzed and ranked at the state and public levels in a *permanent* and uninterrupted regime.

However, not only mean, petty, or mercenary motives and goals are the background of the fake injections and the spread of lies. Their "feasible" contribution of confusion to the public life is made by the humanitarians, who, by virtue of their professional orientation to the world of people and the sphere of psychology, live in isolation from the physical world and are easily intoxicated by the ruling "top", poorly imagining how bread grows, steel is boiled, and energy is released at the fission of the uranium nucleus. The widening illiteracy in the questions of natural science — also one of the causes of the false representations about the world, of the spread and tenacity of myths.

The unprincipledness of the position and the absence of firm convictions among the statesmen and ordinary citizens in a similar way is akin to the renunciation of truth and the patronage of lie.

The "comprador guts" of the powers that be and of the so-called business — again from the same series.

The very widespread opinion on that score that the market allegedly will put everything in its places, both in the sphere of production and consumption, — also a lie or at least a dense delusion. If already by chance, unexpectedly (well, they overlooked, "missed", with whom it does not happen!) there arose man with his thinking (and, correspondingly, everything connected with him, the so-called "artificial"), then, most likely, he in one way or another consciously and unconsciously will interfere and in the nature of all things (or this is already generally beyond the limits of understanding?). Getting burned and making mistakes and learning on them, man will constantly correct both his own life and the influence of the external environment — another path of development, except for the "making of oneself from oneself", simply does not exist. For this reason both the state planning, and the state support, and the state regulation in various fields of production and consumption are quite regular and will certainly be present as

a consequence of the vision of the processes of development by the eyes of the subject (the initiator of everything "artificial"). Another matter is that with all this the question remains as before topical, which also no one is able to cancel and which the subjective consciousness will have to solve permanently in the name of the provision of the steady contentful development — the finding of the optimal correlation or balance of the mutually complementary components of the "invisible hand of the market" and the "state regulation" (i.e., the balance or optimal correlation of *the artificial* and *the natural*).
And, finally, one cannot fail to see today how destructive a weapon (a weapon of mass destruction) the information pandemic can turn out to be and how important it is to be able to verify and establish *the truthfulness* of the information injections. In such a connection, the significance and role of *the technology of interpretation* (in solving the problem of the establishment of truth) as a means of counteracting the threat of the infliction on humanity of all kinds of damage of a global scale by means of cunningly planned information attacks increase immeasurably.

Unfortunately, we do not have the possibility to develop this theme further here.

Everywhere, at all levels of the development of reality, between all its forms of all levels without exception there takes place a harsh competitive struggle for the possession of *the highest contentfulness* or the struggle *for the contentful resource*, which turns out to be a direct consequence of the universality of *the principle of self-development*. The striving to the expression of truth and verity, determined by this same principle, is originally inherent, including, in the very "mechanism" of human thinking (consciousness). And if today a certain lie is considered an ordinary and habitual matter and is accepted "with a bang" by undemanding collectives and communities, then tomorrow there will certainly be found a subject (or subjects) who, obeying the immanent principle of self-development present in him, will "dig up" the truth about this falsity, and all the constructions erected on lying premises will collapse in an instant, and even with the attendant consequences for those who erected the lie on a pedestal. Moreover, such a scenario is realized by no means by reason of the intervention of "higher forces", but under the "pressure" of the objectively everywhere present *universal*, *unconditional, blind, and relative principle of self-development* with its "installations" on the possession of the maximally achievable contentfulness by all forms-levels of the changing reality.

Conclusions

The above set forth we consider a sufficient basis for the following conclusions.

1. The objective reality represents the movement and change of its forms in the direction of the possession by the mentioned forms of *the highest*

contentfulness. The cognitive process can be more effective if the development of reality is examined from the position of *the content-form transformations of unitary directionality*.

2. The human consciousness (thinking) — this is the most abstracted (of the reliably known today) form of the representation of the content of reality, continuing by itself the series of the preceding forms, such as the form of thingness and the form of sensations. Getting rid of the representations about consciousness as an "reflection" or "copy" of reality, human thinking acquires the possibility to see the development of reality as a single ("through") movement of its content by means of ever more abstracting contentful forms; thereby the artificial gnoseological barrier is eliminated, erected by the human consciousness itself on the path of the cognition of the contentfully infinite (multilevel) movement of reality.

3. **The genuine criterion of truth or of the truthfulness of the forms of the developing reality is established. The truthfulness of this or that form of reality is determined by the fullness or the "quantity" of its contentfulness. Hence, the criterion of the truthfulness of the forms of reality is served by their contentfulness**.

4. The above-mentioned criterion makes it possible to *quantitatively* assess *the contentfulness* of the forms of reality, which gives the possibility to arrange them by rank and thereby more precisely and more meaningfully determine the direction of the perspective investigations.

5. Practice is not the criterion of truth, but serves as a procedure (technology, way) of the assessment of the fullness or the "quantity" of the contentfulness of all sorts of forms of reality. In the indicated sense practice represents a particular case of the more general technology, named *interpretation*.

6. The essence of the process of cognition is reduced to the fact that everything investigated and uncognized is assessed, verified, and expressed through the available and existing, the truthfulness of which has already been established and verified by time.

7. There do not exist two or more *equally contentful* truths (ideas, representations, assertions, theories, conceptions, models, opinions, points of view, etc.) with respect to one and the same investigated question or subject of judgment, just as there cannot be *in principle* two or more *equivalent* approximations to the objective truth or to the absolute truth. At any given moment of development among the forms of different approximations there exists only *one* form, the most approximated to the form of the *objective* (absolute) *contentfulness*. This is precisely the form on which one should orient oneself as on the *true* one.

ARTICLE 4

Unlearned Lessons of Dialectics: From Whom and How to Learn to Think Dialectically

Abstract

This article is dedicated to the lessons of dialectics from Vladimir I. Lenin — an outstanding national thinker to whom the ability of clear dialectical thinking was generously gifted by nature. Any work that came from Lenin's pen is imbued with the spirit of dialectics.

Any Lenin's thought is a chain or series of conceptual forms maximally filled with objective content. Any of his theoretical work is a model of masterfully balanced sliding of thought as if on the "razor's edge", the opposite sides-facets of which symbolize the confrontation of two non-identical opposing sides-components of reality.

The aim of this article is to draw the attention primarily of the young reader precisely to these qualities of Vladimir I. Lenin's theoretical works.

In the course of familiarizing oneself with Lenin's theoretical heritage, the circumstance that the research approach he used remains unclaimed to this day, and Lenin's lessons of dialectics, accordingly, remain unlearned, catches the eye.

Since at the foundation of any certain form of reality (object, process, phenomenon) lie two highly abstract and non-identical, yet at the same time objective and interrelated constituent sides-components "content" and "form", the content-form relations (conversions, transformations) come to the fore and become the subject of close attention of dialectics.

Considering Lenin's theoretical works through the prism of content-form relations and identifying on this basis the general regularities of the construction and presentation of material makes it possible to speak about the possibility of creating a single universal methodology for conducting effective research at any level and in any field of reality.

Introduction

As an epigraph to this article, we would like to take words by Vladimir I. Lenin from his work "On the Road", written in 1909: "...this stage must be outgrown; the new circumstances of the moment require new forms of struggle..." [8, p. 540].

The cited quote, in our view, vividly expresses not only the character of a remarkable living and flexible personality but also the essence of the entire life and revolutionary activity of V.I. Lenin: keenly and relentlessly tracking the situation, accurately grasping its changes, and being constantly ready to respond to these changes with the most adequate actions — **new forms of struggle**.

In this article, we will examine and analyze the greatness and scale of Lenin's figure from the standpoint of his innate ability: **to be a dialectician**. Discarding all fictional, doubtful and secondary elements that were thrust into the foreground during the "murky" 1990s — years of merciless reprisals against Soviet power and the USSR — we will focus mainly on this aspect of Lenin's activities and personality in our research.

A dialectical mindset is that indispensable trait of Lenin's individuality which, in our opinion, has not yet received due coverage in fiction and journalism. All other attributes of genius are already derivatives of such outstanding features of his nature: adherence to a scientific approach in studying any issues; striving for objective and impartial presentation of conclusions and results obtained through observations and studies, etc. It was precisely Lenin's natural "immersion" in the mysterious medium of dialectics that provoked fierce hostility and rejection towards him from his enemies and opponents who, lacking this natural gift, could boast of nothing more than inventing plots "out of their heads" and presenting scholastic twists, assumptions, fables and fairy tales.

Another reason for pathological hatred and animosity toward Lenin's personality lies in the inability of his opponents to achieve a penetrating, Lenin-like insight into the essence and order of things; and this unattainable depth of understanding actual relations remains the main irritant for his opponents even now.

What is the strength of Lenin, if even his most die-hard detractors and adversaries nevertheless recognize his influence and authority on a global scale? First of all, in our view, it lies in his philosophical significance and specifically in mastery of dialectics: when foresight is the result of a talent of an individual to see the development of reality through the prism of interaction between directly opposing sides of this (reality). He was what many ordinary and extraordinary philosophizing individuals secretly desire and dream of becoming, realizing however that they fall short, do not measure up, and cannot become anyone similar — because some extremely important constituent elements are missing in the multi-layered structure of their own "I".

It is difficult to find a modern public leader who stands at least level with (on the same step) Lenin — an encyclopedic scholar and philosopher of profound depth,

a brilliant polemicist, consistent and fearless revolutionary, prominent politician and outstanding statesman.

Possession of the invaluable gift of a born dialectician allowed Lenin to handle events and circumstances with exquisite precision, balancing on the crest of the wave.

The accuracy and precision with which historical figures of a dialectical "leaven" walk along the "razor's edge", balancing between Scylla and Charybdis in interpreting the questions under study, evokes admiration and envy in the best sense of the word. Through them (and via them), dialectics charts its way most effectively and optimally. It is precisely through them and their voices that dialectically developing nature speaks to us.

It is regrettable, of course, that the beauty and perfection of thought, say, of Marx or Engels can be appreciated by most of us only thanks to the efforts of translators. Undoubtedly, those translators of the time were highly qualified specialists and quite exceptional people, but as someone aptly noted, reading classics in translation is like taking a shower while wearing a coat. And so much the better that the beauty, clarity and precision of Lenin's thought can, thank god, be known and evaluated without the interference of intermediary translators.

All people (especially outstanding ones) are to one degree or another spontaneous dialecticians. And it does not matter what craft (of mental or physical labor) they possess. Dialectics, ingrained in the flesh and blood of every person, occasionally orients him/her towards certain paradoxical (it seems, from the point of view of common sense) solutions, thanks to which he/she achieves remarkable results and therefore becomes famous among the general public. We refer here, for example, to memoirs and recollections of celebrated personalities: Marshal Zhukov, pilots Pokryshkin and Kozhedub, aircraft engine designer Mikulin, director Eisenstein, cardiac surgeon Amosov, weightlifter Vlasov and many others whose innate art of paradoxical dialectical thinking helped them "squeeze through" literally through the eye of a needle and win unpredictable victories, make discoveries, achieve unexpected and unforeseen success in seemingly unfavorable situations according to everyday consciousness. But Lenin was by no means a spontaneous latent dialectician, whom there are countless numbers of on planet Earth; rather, like Hegel, Marx and Engels, he undoubtedly felt and realized himself as a dialectician and acted accordingly to the dialectical nature of the world and the set of tools provided by this nature: *not inventing* tools out of one's head, *but discovering* them using one's head [16, p. 148].

Accordingly, any conclusion drawn by Lenin is not arbitrariness or fabrication, but a sober judgment based on careful study and meticulous analysis of the established situation with identification of all the "actors and performers".
As mentioned above, through thinkers such as Marx, Hegel, Engels, Lenin, nature itself (the surrounding world, developing reality) talks to us in the language of pure dialectics. And our Vladimir Ilyich looks in this row of

dialecticians even "cooler" than the aforementioned Germans, especially in matters of practical implementation and embodiment of theoretical developments.

Not only "Philosophical Notebooks" (compiled from quotes and notes made in margins of books read) or "Materialism and Empiriocriticism" serve as evidence of the author's deep understanding of the dialectical foundations of building and harmony of the surrounding world, but any of his other works regardless of content, and even solely on formal grounds, confirm his belonging to the ranks of true conductors and tribunes of dialectics.

Why does Lenin's figure attract such close and lasting attention? Because he is one of the greatest dialecticians of all times and peoples — a direct successor and multiplier of the dialectical legacy of Hegel, Marx, Engels.

Lenin is so great and significant in terms of the practical application of the mastery of dialectical thinking that none of the scientists and philosophers of all stripes who lived after him and live today can currently be placed alongside him in this respect. Brilliants of such size and cut appear once in hundreds of years.

Completely distancing ourselves from the heap of lies and absurdities expressed about this outstanding thinker during the so-called "time of trouble" at the end of the last century (let this remain entirely on the conscience of talkative simpletons), we will assess the scale of Lenin's personality from the perspective of the spirit and atmosphere of his theoretical works freely available: please, feel free to read, verify, adopt or refute what we have presented — depending on your comprehension and preparation.

With the expectation that this article may provide some support in mastering the art of dialectical thinking (which is especially important for students of both humanities and technical universities), we will demonstrate and reveal, using Lenin's works as examples, the beauty and harmony of the dialectical method in opposition to mechanistic, metaphysical, eclectic and scholastic ways of thinking.

Ultimately, what is important to know when studying various forms of reality: object, process, phenomenon, etc.? It is essential to identify and track the logic, historicism, trend, patterns, direction (*i.e.*, the *contentful* side) of the development of these forms of manifestation and existence of reality, for which it turns out to be absolutely necessary to observe **how** transformation (transmutation, conversion) of one form of reality into another takes place, and furthermore, on this basis, try to forecast such transformations (transformations, conversions), anticipating not only the change of existing forms but also the emergence of new forms. This constitutes the subject matter of dialectics. Ultimately, it comes down to studying the surrounding world (nature, man, society) from the position of ***content-form*** transformations, transmutations, conversions [2, 3, 7, 18].

Every serious researcher, embarking on research work, proceeds from the premise that reality (the surrounding world, nature) is always at least dual-sided (*i.e.*, double-faceted). Any real specific object, process or phenomenon in its most general abstract form represents a relation of two principles (sides, constituents, components, "opponents" etc.): {content/form}. Consequently, any concrete form of reality (implying: object, process, phenomenon) is determined by the correlation of these noted sides-constituents-components within each of their specific relations. The development of forms of reality itself represents changes in the correlations of these constituent-components within their relations. In this connection it becomes obvious that forms of reality defined by the aforementioned ratios can be either more or less *Contentful* (due to different shares of content and formal components in their relations). The overall trend of development and change of forms of reality — as human observations throughout human history show — is such that during their (forms') development there occurs a shift in the ratio of components (in their relations) towards the numerator of the relation (if we consider such a relation as a mathematical fraction), i.e., toward the *Contentful* component of the relation (meaning the fundamental orientation toward the general movement-development of forms of reality in the direction of increasing their *Contentfulness*, and ultimately achieving ultimate highest *Contentfulness*) [5, 7]. This setting-orientation indicating the direction of variability of all forms is called the universal principle of self-development (self-organization) of reality, formulated as follows: the development of the content of forms of reality takes place in the direction of exhaustive expression of developing content by the very same developing content of these forms [3, 5, 7, 18].

Applied to the surrounding world, this formulation means roughly the following: everything that exists and develops has the direction of its development and existence expressed (i.e., encompassed, absorbed, assimilated, comprehended, etc.) by itself existing and developing. As a visual example in this case, the image of a "self-winding" three-dimensional spiral seems most appropriate [2, 7]. And such an orientation or tendency of change-movement-development belongs to all developing forms of reality without exception.

For greater illustrativeness of what was just said, note that with regard to such a level (area) of developing reality as, say, man and society, this universal principle drives forward not only positive (from the standpoint of human consciousness) morally ethical and humanitarian aspirations of man but also negative ones (again, in terms of human consciousness) — his thoughts, motives, secret impulses and "sinful" inclinations — such as arrogance and condescension, feelings of exclusivity and superiority over one's neighbour, envy and vanity, etc., etc., Everyone intends and strains to present himself and appear as the most significant, competent, respectable, successful, etc., in short — the most contentful, which is also determined and conditioned by the same universal objective striving of any forms for possession of the highest contentfulness. After all, how sweet and tempting it is to participate in some kind of political hangout and be considered in this world an influential person — a disposer of human destinies!

Thus, in light of the dialectical concept of development presented here, **objective reality** represents motion and succession of its forms in the direction of possessing the highest contentfulness (i.e., maximally achievable content), and all processes of development and cognition of reality should be studied and viewed through the prism of *content-form* transitions, transformations, transmutations of unitary (i.e., strictly defined) directionality.

A specifically directed variability of the abstract relation {content/form} is conditioned, on the one hand, by the unity and, on the other hand, non-identity (non-sameness) of its components, due to which both components are in a state of interaction and inexhaustible movement towards convergence with each other and acquisition of equilibrium (balance) or mutual expressibility by each other (which means: becoming maximally contentful for form and defining its perfect form for content). The presence in one integral relation of two components with different types of activity generates a whirlwind, vortex, circulation, "self-winding" spiral, i.e., a specific type of change (movement, development) of both components of this relation and the relation as a whole.

The famous saying of Heraclitus about everything flowing and changing still left open the question of where exactly everything flows and changes — clear ideas were lacking until now. Only today does the opportunity arise to answer this question more or less sensibly; today we can meaningfully define the vector of this universal movement: everywhere and always there is total multi-level movement towards reaching **the highest level of contentfulness**; everything is pervaded by the striving and covered by movement towards possession of the highest contentfulness. This universal movement vector determines causality, meanings and goals: life, development, evolution, history, etc., i.e., the existence of anything whatsoever, in whatever forms.

The algorithm of development — common and universal for all levels-forms of reality, from photon to the most elaborate conceptual schemes and constructions in individual minds: new content will always strive to acquire a new form, while forms seek to be filled, enriched with new content. Hence — a vortex-like motion of everything. By this conception, only the typical, standard character of the course and transformation of things at all levels is pointed out: the universal generalized relation {content/form} is embodied on each specific level in its own concrete form and consistently "proceeds" through levels towards replacing relations with increasingly more contentful ones.

The movement or striving to achieve the highest contentfulness (as **a single goal** for all changing forms of reality) conditions the fiercest rivalry and competition between such moving and developing forms of reality. The inevitable competition and rivalry arising from this movement (**movement toward a common finish line**) manifests itself as confrontation, opposition and interaction of real objects, processes and phenomena at different stages, in different areas and at different levels of their existence-movement-development.

In geopolitics, this can be expressed by the confrontation and opposition of components in such relations, say, as {West/East}, {metropolis/colony}, {global/national}; in politics and economics — in relations {internationalism/nationalism}, {proletariat/bourgeoisie}, {wage labor/capital}, {liberalism/conservatism}; at the biological object level — in relations {male/female}, {man/woman}, {masculine principle/feminine principle}, {right side of the body [of living organisms]/left side of the body [of living organisms]}; in physics — by relations {time/space}, {energy/mass}, {wave/corpora}, {negative charge/positive charge}, {motion/rest}, {acceleration/gravity}, etc., etc.

Being an entirely abstract construct, the relation {content/form} is **fundamentally** not manifestable in its most general form or image, but it nevertheless constitutes the core or very essence of any and every real concrete form (object, process, phenomenon, etc.).

The noted duality of constituents-components of real forms-relations with a very strict and definite directionality of content-form transformations during the interaction of these constituents-components explains the moment-to-moment **uniqueness** of the emerging world (Universe, nature, life, etc.) as a whole, as well as **the unique and unprecedented diversity** of existing and nascent forms as individual elements of this world.

The abstract relation {content/form} with quite unequivocal directionality of change-movement-development of its components or constituents, just like the entire relation as a whole, is something that exists originally, everywhere, objectively and independently of any particular concreteness; it is what pervades all existing and emerging concrete forms-levels-relations of surrounding reality due to its omnipresence. It is precisely the *content-form* transformations described above (i.e., changes of components and their relations in a strictly defined direction — towards achieving the highest contentfulness) that underlie the development of forms of reality, which are themselves only a concrete embodiment and incarnation of the model presented above (*i.e.*, the abstract relation {content/form}). And it is exactly this initial model, owing to its foundational and universality, that is most acceptable and effective for deep study, research and penetration into the essence of the surrounding world (developing reality) at the current stage of its development.

This investigative approach demonstrates its effectiveness through examples of successful studies of issues that until recently were considered highly problematic and "tricky" [5, 6].

Why do content-form relations suddenly come to the fore, become the core and subject of examination and study of dialectics? Because the very fact and the corresponding irrefutable assertion that there does not exist a single real object, process or phenomenon devoid of content and/or formal sides-constituents inevitably leads to the conclusion that content and form are those two "**principles**" (two main key components, constituents, "opponents", etc.) which,

interacting (opposing and simultaneously complementing each other) within the unified integral relation {content/form}, create ("generate") and reproduce so-called **objective reality**, i.e., the entire surrounding world (including ourselves) with all the diversity and uniqueness of its forms.

According to the textbook definition, dialectics is "the teaching about the most general lawful connections and becoming, development of being and cognition, and the method of creatively cognizing thinking based on this teaching... The fundamental principles of dialectics, constituting its backbone, are universal connection, becoming and development, which are conceptualized using the entire historically established system of categories and laws" [15, p. 154].

The priority of the categories {content/form} over all others is obvious and confirmed by the circumstance that in the foundation of all other categories and concepts (just as of the actual objects, processes, phenomena of the physical-objective level of reality denoted by these categories and concepts), one can easily discover ubiquitous *content-form* beginnings-constituents-components.

It goes without saying and is undeniable that no one will ever be able to encompass (i.e., comprehend) the entire volume of connections and the total sum of changes occurring in all elements of the surrounding world (starting from photons, including the abyss of atoms, molecules, living cells, etc., and ending again with bizarre ideas and fantasies in the heads of individual human individuals), but grasping and covering the trend or patterns of such changes with human thought (from the standpoint of human thought or consciousness itself) still turns out to be possible.

Here is what Lenin writes on this matter in his book "Materialism and Empiriocriticism", referring to just a relatively small segment of reality — the global economy: "Each separate producer in the world economy is aware that he introduces a certain change in production technique, each owner is aware that he exchanges some products for others, but these producers and owners do not realize that they thereby alter social being. **No 70 Marxs could have covered the sum of all these changes in all their ramifications in capitalist world economy**. At best, the laws of these changes have been discovered, the main and basic objective logic of these changes and their historical development has been shown... From the fact that you live and manage your affairs, give birth to children and produce goods, exchange them, an objectively necessary chain of events emerges, a chain of development independent of your public consciousness, **never fully comprehended by it**. **The highest task of humanity is to grasp this objective logic of economic evolution (evolution of social being) in general and basic terms in order to adapt one's public consciousness to it as clearly, distinctly and critically as possible**..." [11, pp. 317–318].

Thus, the "objectively necessary chain of events" (including an objectively necessary change in forms of economic management) determines or sets the direction of change-movement-development-improvement of forms of human

public consciousness, generating a so-called algorithm for changing its (human consciousness) forms. The abstract forms of human consciousness (thought) arising or newly appearing in this connection grow out of more concrete forms by transforming their content to a new level of reality while preserving continuity and compatibility of contents of both — i.e., abstract and concrete — forms, which ultimately testifies to the contentfulness (objective contentfulness or truthfulness) of the entire chain or set of interconnected forms (from concrete to abstract ones) [5]. From the "objective logic of evolution of social being", there follow: both "...the highest task of humanity — to grasp this objective logic of economic evolution (evolution of social being) in general and basic terms..." (according to Lenin, see above); and, in a broader sense, the task to define and cognize the direction of development of reality and, accordingly, the goals and meanings of life and development of mankind as a contentful movement (and succession) of cognitive forms of reality towards possession of the highest contentfulness. Solving this last problem implies providing human thought with increasingly exhaustive and all-embracing methods of prospective, predictive, prognostic, anticipatory cognition. Efforts should be concentrated precisely in this direction — on cognition of patterns of change and emergence of forms of reality, on cognition of patterns of its (*i.e.*, reality's) *content-form* transformations. It is here that the ideological justification of the essence (and existence) of man lies; it is by this that the perspective of life and development of all mankind as a whole is determined. **And who, if not us — direct heirs and successors of the legendary bearers of priority ideas of the Great October — should continue to embody this revolutionary ideology into practice, into life !!!**

With the destruction and loss of the USSR, Russia lost the prospects of its further development previously outlined. Lenin and his comrades, being deeply enlightened and educated people, clearly understood what the formulation of goals and perspectives of movement-development meant for an individual person and for a nation as a whole. Without formulating a goal and prospect of development perceived and approved by the people, no initiatives, initiative, enthusiasm can exist on a "mass scale". To unite and organize the masses, **public** goals, directions and prospects of country (state, society) development must be formulated according to which a strategy for achieving these goals and prospects is developed. Moreover, defining a perspective should not boil down to an immediate reaction to external and internal so-called challenges and irritants but must be drawn up taking into account long-term forecasts and strategic plans. Why did Lenin and his like-minded associates understand this? Because **the quality** of those country's leaders was immeasurable compared to today's; they were people of a high level of consciousness and, respectively, personalities of quite another scale.

Under the rule of today's voracious and insatiable "locusts", such "trivialities" are not mentioned. Furthermore, current "rulers", waving off public demands for ideology, do not even understand what is expected from them. Thus,

patriotism has somehow migrated into the realm of ideology and is presented to citizens of the country as an ideological prospect, although any reasonably educated person should realize that **patriotism is not an ideology but a feeling** instilled (or not instilled) in a person with mother's milk (and possibly already present in embryo at the genetic level), but requiring, as a rule, further cultivation and education. **An idea**, however, is something different from a feeling; it is a product of a completely different level. An idea is, speaking figuratively, the light at the end of the tunnel for every enlightened mind. A developed person cannot imagine himself without an idea and ideology. Feelings, sensations, needs, interests, "values" (in the meaning of this word used by the "Western" world) — these are all products of more "down-to-earth", though also more fundamental levels-components of the human "I", whereas an idea is a product of the highest **of reliably known today** levels of the latter — the level of human consciousness (thinking).

An idea is based on feelings, continues them, but by no means reduces to them or is exhausted by them. An idea ignites a person from within and guides him through life like a guiding star; but not everyone, only one prepared, ripened enough to perceive this idea. Hence: **you may not be a bearer of an idea, but you must be a patriot!** — without any ideology, simply by right and by the feeling of one's belongingness and relatedness to a great people.

Undoubtedly, of course, once an idea arises, it begins to influence the feeling in turn, developing and enriching it, from which **spirituality** of the human personality emerges, having the most direct connection with patriotism. But primordially in this tandem is still the feeling.

If patriotism is mainly cultivated, then ideology, being a category of worldview, is formed on the basis of knowledge, *i.e.*, through educational means. For example, the socialist idea, based on developed feelings of justice and patriotism, is already the beginning of a renewed ideology. Yes-yes, renewed (emphasized specially for the current "rulers" and their ilk), built with consideration of previous blunders and lack of information, natural for the previous epoch. And there is no need to frighten the people or hope that everything will end again in levelling and stagnation: a ship reaches its destination not only and not so much because it was correctly oriented at the start of the journey, but mainly because its course is periodically corrected, clarified, changed according to circumstances. Improvement of wage systems and procedures of accounting and control, as well as turnover and renewal of personnel at all managerial levels from top to bottom — just as with the classics, but clearer, meticulous, thorougher, more energetic than before — will eventually produce the expected positive effect. Back then, there was no time for details; all attention was focused on creating foundations. And now it's not easier, but with a solid foundation underfoot, it is still simpler to timely determine the directions of relevant and vitally necessary changes.

Besides, today's civil society is different — older, more responsible, demanding, exacting...

The people are not against the socialist idea per se, but against its ossified forms and against party functionaries of the past and present (including those sitting in parliamentary factions and supposedly opposing power), who parasitize on this idea in its deadened, dogmatic form, who have not changed since the hour when they betrayed this idea, burying Soviet power with its institutions (although the organs and structures of Soviet power needed to be improved and modified, as Lenin himself always pointed out — in each of his articles one can see how flexible, optimistic and "creative" he was in his aspiration toward updating and perfecting the forms of the revolutionary movement).

The question or idea of building a renewed socialism meets the demand of society for a new ideology. At the same time, the course toward building a socialist society and a socialist way of life is no longer an end in itself, but merely one of the main conditions and means of ensuring further contentful development of man and mankind as a whole.

However, it would be more correct in this case to speak not about the enthronement of some kind of renewed socialism, but about the manifestation and formation of another stage of the socialist movement or about the embodiment of the developing socialist idea through yet another of its forms. The absence of an ideological perspective "vacuums" human consciousness. At the same time, reliance on the old tried-and-tested religious idea is fruitless, since the latter slowly but surely fades away. Having played, without any exaggeration or doubt, a progressive role in its time, but unable to satisfactorily answer the increasingly acute and problematic worldview questions of young inquisitive minds, archaic god-centered doctrine will lose its relevance and naturally, without any violence over it, recede into the background, giving way to new worldview concepts (similarly, say, as horse-drawn carriages are still encountered on our roads, but the bulk of transportation is carried out by modern modes of transport). This trend is visible to the naked eye. Therefore, today's "rulers" should not beat around the bush. It's a pity for the youth: at the state level, "popovshchina" is being pushed through instead of focusing on literacy and education. With a balanced and effectively functioning system of **upbringing and education**, there will be no loss of spirituality accompanying the alleged decline of religion. Where does this categorical nonsense come from — that morality, ethics, humanism are allegedly always conditioned by a religious idea? The aforementioned categories and notions (from which the spiritual and moral bonds and guidelines of many human communities are "woven") arose and took root in human life as the transformation and improvement of forms-levels of human consciousness proceeded during man's development; one might think that Prince Svyatoslav, being a pagan, followed the moral instructions of god Yahweh (Jehovah, YHWH, etc., depending on reading) when he uttered his immortal: "Idu na vy" ["I go upon you"] or "Mertvye sramu ne imut" ["The dead know no shame"], — all this came from the

deep nature of man, from his contentful constituent, acquired through historically changing forms of human consciousness in the multi-layered, multi-level structure of man: both in the form of "spirit", and in the form of "soul", and in its later complex form — the human personality.

To obsequiously cross oneself, relying on the supreme deity, requires little intelligence. It is certainly easier than taking full responsibility for the destinies of the country and mankind solely on the strength of one's own abilities and possibilities. For an individual preferring to dwell on platforms of religious concepts, the issue of responsibility is predetermined: fate and prospect will ultimately be decided for him by god with his prophets. There seems to be no dilemma worth a cracked egg: choose whomever you like — believe and rely on the omnipresent "uncle" or don't believe and rely on yourself. Nevertheless, finding oneself suddenly, even in shallow water, none of the believers stops struggling and fighting the wave, although, following their own logic, they could fully depend on the almighty supreme saviour... Any "ruler" should first learn, besides parish school, proper teaching of natural science (natural-scientific disciplines) in a Soviet university and not skip classes. Such a proven profile of the educational process undoubtedly contributed to acquiring a correct worldview orientation adequate to the level of cognition of developing reality achieved by human civilization. It is sometimes awkward to observe and listen to grown-up "underdevelopeds" with several (by their own words) "completed prestigious higher educations" discussing with a thoughtful air on some political-economic show or forum about "good and all good" in the guise of Christ or universal "evil and all bad" in the image of the devil. The advice in this case can only be: study Lenin's lessons of dialectics, miserable C students!

However, for a more or less adequate understanding of the substance of multi-level reality, initially one should firmly grasp **only one thing**: EVERYTHING THAT exerts any influence on our level of reality (i.e., the level of human consciousness) and tries to correct (interfere with) our lives, claiming the status of Absolute, ITSELF occupies a subordinate position and is represented by equally imperfect and non-absolute form, likewise dependent on influences (impact) of forms of all other levels of reality. **Absolute is impossible in principle!** — and development of reality, never ceasing for a moment, continues as the movement of the contentful component beyond the limits of its forms ceaselessly and infinitely. As Absolute, human consciousness takes simple **aggregate of forms** of various kinds (including those accessible only to subjective imagination) levels of reality.

Orienting on a model of reality's development based on representations of *content-form* transformations proceeding in the known direction, one clearly and unequivocally understands that man with his consciousness is not exhausted by subject-sensory-thought formation (i.e., three-dimensional physical-material level-form of existence in time and space of his flesh), but "extends" beyond the obvious boundaries of his bodily confines. The very process of development, the very developing multi-level reality (as motion and succession of forms of this reality) is even more inexhaustible and unlimited by the reached level-form of

man and mankind. However, in what transformed form the subsequent contentful movement continues with transition to the next (next after man) level of reality remains to be researched and studied. Still, even today we can say quite definitely regarding this matter that the form of clothing of the contentful principle on that next level of reality's movement differs in increased informative or energy (*i.e.*, *contentful*) "capacity" and "capability" compared with preceding forms-levels, and therefore it is even more abstract than the preceding forms-levels.

[When moving to the next level of contentfulness of forms (to the next level of development of reality), importance for any individual, as a certain correlation of components in the relation {content/form}, will have only what — with what intellectual-spiritual (contentful) developments the transformational contentful constituent (principle) of this individual transforms onto that level. Since that next level is "abstracted" (abstract, abstracted) to a significantly greater degree than the preceding ones, it goes without saying that neither yachts nor mansions with Mercedes cars can be dragged along there. What matters will be the accumulated during the "earthly" cycle spiritual-intellectual potential and experience of dealing with abstraction, whereas yachts and Mercedes cars — as well as all other material tools — are merely auxiliary auxiliary means expanding the framework of formal framing of the developing contentful constituent for further disclosure (development) and multiplication of this very potential. Hence, it is important to properly dispose of these means during the period of "earthly" life. This explanation is addressed primarily to those who want to see further than the tip of their nose. Ultimately, the ability to identify, generate and use ideally abstract forms of a new level, maximally filled with objective content, *i.e.*, true forms (see article "Universal Criterion of Truth" in this collection)].

Ego-centric and poly-centric models (pictures) of the world (including: theo-, socio-, anthropo-centric models) are receding into the past. They are being replaced by a concept of **a single universal internal principle of self-development**: all forms-structures of reality change and develop under the management (*i.e.*, under the auspices) of a universal "mechanism", algorithm, inner principle immanent to all form-structures of reality regardless of their level, stage (place and time) of development. This is a model (concept) of *content-form* transformations in the direction of achieving the highest *contentfulness* by any and every developing form of reality. To understand and anticipate the change and development of real forms, to look as far ahead as possible "around the corner", "beyond the horizon" — this is the main task that will stand before man and which man will be forced to solve quite consciously (thoughtfully) both in the near and distant future for the sake of preserving himself as a species and surviving in competitive struggle with other forms-levels of reality. Without awareness of this circumstance, man will not be able to fully confront so-called challenges from nature (the surrounding world).

Humanity is painfully parting with the aforementioned models, theories and pictures of the past; hence there is a new energetic surge of religious, ethnic,

national, racial, civilizational and other similar conflicts and wars. A worldview crisis of faiths, ideologies, all kinds of "values", priorities and exclusivities (the notions of exclusivity and absolute form lose their former significance and informational value, receding into the background and making room for concepts of **equal uniqueness and irreplaceability** of forms) gives way to another worldview model [2, 3, 5, 7, 18]. Previous orthodox preferences require clarification, supplementation and replacement by new more *contentful* models and forms.

However, the task of finding balance and correct correlation between interacting constituents in the relation {content/form} at present and identifying the trend of change of this balance — for the future — remains as relevant as ever. In accordance with the universal principle of self-development (see above), multi-level change, movement, development of forms takes place (in contrast to the principle and mechanism of "functioning" of various centeric models) by "piling up" (*i.e.*, developing) their content, "making from oneself". With the emergence and establishment of a new concept of the development of the surrounding world (replacing losing meaning and strength God-centered theories), inevitable earlier wars and rivalry of religious ideologies will recede into the past.

What was the *contentfulness* of that supposedly over-ideologized Soviet era? What inspired, motivated the Soviet person to move forward?

The romance of everyday life was built on the dictate of the heart, energy of impulse, fascination with breaking through to the new and unknown; proceeding from the need of the soul, man was ready to discover what had not been discovered, comprehend what had not been comprehended, conquer nature, space, taiga, virgin lands, peaceful atom, etc., etc. It was about unleashing and liberating man's inner forces and creative energy in the process of constructive labor for the sake of achieving common goals and ideals (including well-being, but by no means in its hypertrophied phase clothed in the guise of the golden calf with prosaic accumulations). By refusing the elevated approach to setting, formulating and achieving socially demanded ambitious goals, we "throw out the baby with the bathwater".

From the very first days of Bolshevik Soviet power, the issues of actualizing (awakening) the energy of impulse, enthusiasm and initiative of the masses arose in full force. The solution of both highly complex and simple everyday problems implied and required **not only** routine strain of physical effort but also activation of cognitive aspirations of man, inciting him to satisfy his innate human curiosity. One should primarily learn *contentful* thinking from Lenin. Lenin fully realized that human efforts ultimately aim to forecast, anticipate, predict with increasing accuracy the perspective of development of real events, build sound plans and correctly set priorities in their implementation, which meant — learning to look further and more successfully "beyond the corner", "beyond the horizon" (i.e., looking into the future).

Two paths are known and possible for increasing, accumulating and multiplying the own *contentfulness* (volume or fullness of content of one's own form):
1**. Appropriation** of someone else's content ("foreign" volumes, accumulations of content belonging to other forms); as a particular case of this variant — simple destruction (destruction, liquidation, neutralization) of an "adversarial" form that impedes or hinders the movement-development and enrichment of content of one's own form.
2**. Cooperation** (symbiosis) with other forms and joint accumulation, increase of content of each of the interacting and cooperating forms.

Needless to say, combinations of these two variants are significant.
Applied to the development of human communities, the essence of one and the other path boils down to the following.

The first path is the path of war, violence, coercion, applied, for example (at the level of states and peoples), by metropolises toward their colonies (subjugation by metropolises of the will, appropriation of natural resources and fruits of labour of colonial peoples and nations). To date, humanity has mastered and refined precisely this path.

The second path, the socialist path of development with indispensable attributes of cooperation among people and achievement of goals jointly, is still in embryonic state; it was exactly this method of socialist construction and creation of a new type of public order on a mass scale that V.I. Lenin advocated.

It is well-known (and confirmed beyond doubt by processes taking place during the not-so-distant times of the breakup of the USSR) that initial capital accumulation proceeds, as a rule, by violent and fraudulent means — by appropriation and seizure.

We have all witnessed how the redistribution of public and state property, capitals and assets took place in post-perestroika Russia and other republics of the USSR that suddenly became "independent". This was a path of deceit, swindling, gangster feuds, mockery of privatization coupons and pledge auctions. The methods of executing this grand-scale fraud were, without any exaggeration, predatory, and they relate entirely to the first path (variant) of increasing *contentfulness* (*i.e.*, enrichment) of the most active individual reformers (young and not so young).

Undoubtedly, reverse expropriation of property and assets acquired in such a manner also implies, to some extent, responsive violence at the initial stage of building socialism. The retaliatory move is inevitably connected with redistribution of once criminally appropriated or wrongly amassed "bourgeois" property and financial assets, but this procedure is carried out in the interests of the overwhelming majority of working population (citizens of the country) and for the sake of restoring historical justice.

As regards **the legality** of expropriation of property and capitals during times of socialist revolutions, the procedure is performed, as already mentioned, in the interests of the vast majority and is single-time (within a limited-short timeframe); and whoever thinks that such procedures can be dispensed with at **periodic revolutionary iterations** is deeply mistaken or simply ill-informed regarding **the inevitability of substantial transformation** of current foundations into the configuration of future public and governmental structure. This stage is necessary, in particular, for redistributing initial capital in the interests of **the majority** of the population in order to create normal starting conditions (positions) for ordinary workers and to restore a justified balance with the positions of aggressively pushy and shameless (for the most part) minority that once usurped assets not belonging to them.

Yes, development proceeds, and history is written "by tacks", zigzags — every time returning to itself at a new level by segments of spiral turns that never fully line up and are never perfectly finished. Such is the external appearance and character of the dialectical mode of development of anything whatsoever. Somewhere again forced measures of expropriation will be needed, because otherwise it just won't work: **nobody ever voluntarily surrenders what was gained in the sweat of others' brows and appropriated in the sweat of one's own brow**. One must be quite naive and unschooled in practical life not to understand this.

In contrast to the first path, implementing the second option for increasing the *contentfulness* of real forms of public order means immersion into socialism, toward which man is increasingly pushed by emerging circumstances regardless of his consciousness; and we will have to revive and continue this path whether we like it or not because further *contentful* development of mankind outside of this path is unprofitable, suboptimal, inefficient, "dead-end" and therefore unlikely. And deeper study of socialist theory will be required. And again, one will have to acknowledge the fairness and scientific nature of Marx's approach applied in working out social and economic theories (otherwise, gentlemen courtiers-apologists of today's socio-economic foundations, you will simply lose your target "fan" audiences and, as a consequence, your piece of bread; then there will come time to laugh good-naturedly at those who arrogantly mocked the orthodoxy of Marxism and indulged in primitivism of scientific communism — well, sirs, he laughs best who laughs last).

Following Lenin's methods and research tools, we can state today that thanks to applying the dialectical approach or method of cognition, much of what is called world order becomes clearer than before. At the same time, the still-relevant task does not diminish but rather stands out even more clearly: to keep learning how to see the future picture more accurately (*i.e.*, learn to look ahead "around the corner" with ever greater efficiency) so as to understand ourselves and surrounding reality better.

Solving this problem is identical to solving the eternal issue of finding meaning in life for every individual person, which (solution), in its first approximation, takes on the following form: everything existing moves in a single direction towards expressing objective truth in its most *contentful*, ultimate form — *i.e.*, a form endowed with the highest (objective) *contentfulness* or the form of so-called "absolute" truth. This path undoubtedly belongs not only to any separate individual but also to whole peoples and states. Knowing this, we must and should lead this movement (process) since we are currently the best informed about it and understand it best. Following the course towards achieving the highest *contentfulness* by forms of developing reality (including humanity) is also a movement towards effective resolution of the perennially troubling human question regarding the possibility of cognizing and cognition of objective truth.

What is life, motion, development, progress, etc., in general terms is already understood: it is a process of *contentful* filling of forms while striving for them (at all levels without exception) to possess the highest (objective) *contentfulness*. It is a process of "unleashing" the inner content of reality and presenting it outwardly in the most c*ontentful* form possible at any given moment, approaching each time the form of exhaustive expression of objective truth. With small acts of subjective human movements (whether achievements in painting, literature, music, sports, science, etc.) humankind approaches closer to the fullest expression of **the objective content** of developing reality (expression of **objective truth**) with each such elementary act. Every sound, every note produced by a skilled musician or composer seeks to bring to light and reveal to the world objective truth — *i.e.*, the most *contentful* form of representation of reality at that particular moment (from the viewpoint of the maestro). The same applies to poetic word or brushstroke on an artist's canvas, let alone the *contentful* theories and concepts of a scientist. **From the most *contentful* subjective opinions and views on the world, objective truth is formed** [5].

But understanding and awareness of the general trend of real processes by no means exhausts the solution of all current issues: the crucial and essential question for man remains open forever — the question of anticipating, foreseeing, preempting, predicting with maximum accuracy and certainty changes (variability) of existing forms of reality and emergence (appearance) of new ones, and taking into account this circumstance — the question of **planning subsequent human activity**. Well, and since man by his very nature and place in the chain of development is a highly active link-component (in other words — subject of activity), he inevitably interferes with the development of reality and embodies thereby his own vision, understanding and "plans", impacting the surrounding world and changing it in the direction required by him (strictly in accordance with the aforementioned universal principle of self-development).

Despite our ability to define the meaning of life and existence both for man and his entire environment today (see above), the matter still lies in learning

to anticipate the change of existing forms of reality and the appearance of new ones, in order to predict events and developments as precisely as possible, to learn to peer deeper into the future — and not just to satisfy immediate curiosity, but mainly to survey and outline distant prospects.

Development is the succession of forms of reality aimed at creating and establishing forms filled with higher objective content. All ongoing processes in the surrounding world are "targeted" at enhancing the *contentfulness* of existing forms representing changing reality. In this lies the essence of the orientation of transformation of nature in the universal cosmic dimension. The search for, acquisition, comprehension of truth, *i.e.*, discovering the most *contentful* forms of representation or acquiring developing objective content, permeates all of nature — from living thinking beings (with their specific subforms in the guise of ideal abstract constructs of thought) to an inanimate stone-boulder, and any molecule, atom, electron, photon (quantum) within this stone or beyond it. And no empty speculations on this score, embodying former "highbrow" (sophistical, demagogic, speculative, scholastic, etc.) philosophy, are probably needed anymore, since they turn out to be low-*contentful* and therefore fruitless. Philosophy gradually changes its status and role, turning from a habitual tool of passively descriptive and explanatory type into an instrument of actively prognostic, predictive and transformative character. Its speculative nature, conditioned by centuries-old intrigues or games of idle human mind, finally turns itself into an uninteresting useless "thingie", a whimsically intricate relic of the past. Dialectics comes forward as the core and embodiment of a new, deeper philosophy, as the art of generating and bringing to life correct forecasts and planned transformations conceived by man. And here our updated philosophy meets its inevitable merger and fusion with science, as was excessively discussed throughout the 20th century.

Summarizing the above in two words, we have every reason to draw the following conclusion: **to learn to understand and know how to see the perspective of development of reality, *i.e.*, the perspective (orientation) of change of its (reality's) existing forms and emergence (appearance) of new ones, and on this basis plan subsequent human activity** — this is the main task facing the man of the future, worthy of investing any resources for its gradual step-by-step resolution.

The socialist idea is closest, most responsive to the very spirit of the Russian person, whose essence since time immemorial has been considered an inexhaustible craving (aspiration) for justice. Truly popular can only be the power that professes exactly this idea; when a working person can feel with every cell of his that this is his native people's power — then he will defend it, and cherish it, and nurture it, and improve the institutions of power, and invest with enthusiasm his strength and energy into "arranging" life. But if we have given the land, its subsoil, national wealth and means of production into the

hands of "scoundrels", allowed them to fence themselves off from the people with high fences and armed security regarding all this primordially people's property — then where can unity for the sake of a common goal come from — no matter how you "blur" the eyes of your fellow citizens with pharisaic slogans about the supposedly "national property".

The craving for justice inherent in every Russian person and, as a derivative of this property of the soul, the aspiration to save one's neighbor are conditioned by his natural inclination to search for and find balance (equilibrium) both inside and on the outer contour of society in opposition to encroachments (aggression) on freedom and dignity both at the level of an individual person and at the level of human communities.

The social orientation of the state or public structure in this case should be determined **by the officially proclaimed policy of the state**, not by charity, assistance, petty handouts, voluntary donations or patronage timidly pushed through from time to time and on the sly. Of course, a state of this type must be built on principles other than the existing ones.

It is necessary to return to the working person **the feeling of involvement** in a great cause, a great people, a great country with its innumerable natural resources and national wealth; return **the feeling of involvement in a great common goal**, most effectively approached **by joint efforts** using **socialized means of production**. When there is such a feeling, which in turn revives and nourishes feelings of human pride and dignity, — then a person is ready to give himself entirely to the common cause, which inevitably becomes the personal cause of everyone. **We must return to our people the lost sense of self-worth inherent in the Soviet man**.

Does *the first tentative approach* to mastering the socialist idea mean the complete collapse of Marxism, Leninism, theories of socialism and scientific communism, etc., as primitive and short-sighted politicians, political scientists, philosophers, economists believe? ***Of course not!*** Humanity will return to such fundamental currents and theories more than once, approaching them in a spiral-cyclical way (or by successive approximations) — in full accordance with the nature and character of the *content-form* (dialectical) movement-development of reality — to an increasingly exhaustive version of their implementation. And something here suggests that the point of view of the wise classics of Marxism is not devoid of grounds and will, in the end, prevail in the structure of searching for the optimal path of mankind's development, since it most fully corresponds to the inner content of man, his mood, oriented towards preserving human identity, culture, traditions, dignity (accordingly to genetic predisposition, genetic matrix, genetic code and the so-called call of ancestors and blood). According to the formulation of the principle of self-development, everything existing and developing periodically returns "to its own circle", but in other, more *contentful* and enriched forms.

Dialectics is the art of finding balance of interacting sides, which (art) Lenin possessed impeccably and perfectly. For Lenin — it is always a result-oriented search for the optimal correlation between the most essential sides-constituents-components of development (in their relation): in the range, for example, from de-kulakization and surplus-appropriation to the introduction of a food tax and NEP, or from asserting total collective ownership of the means of production to establishing and recognizing as relevant a mode of production with elements of private property, etc. In this regard, first of all, his ability to find and highlight the most essential sides-constituents of reality, being in direct interaction and relation to each other (*i.e.*, in live confrontation and opposition) precisely at this particular segment of their development, and already on this basis — to demonstrate the ability to forecast the trend of change in the correlation of identified sides, and along with this — to anticipate the further course and perspective of development of the entire relation as a whole. And it looks absolutely fantastic to be able to identify sources of renewal (inflow, increase, receipt) of *Contentful* energy in pairs of interacting components and further — to anticipate and track the bias of *content-form* transformations (transmutations) of these components and their relations as a whole.

It is on considering issues similar to those touched upon above that we will focus, studying and analyzing the works of V.I. Lenin from the standpoint of their being imbued with the spirit of dialectics.

Any article or work of Lenin is a dynamic creation, structured according to a universal scheme corresponding to the dialectical nature of the development of reality itself (*i.e.*, according to the scheme of tracking the change-movement of interacting forms towards achieving their highest *contentfulness*): the variability of the correlation of two interacting sides-components in their relation is investigated with subsequent forecasting of the development of the result of this interaction towards (into the area) of predominant increase in the *contentfulness* of the active component and the relation as a whole.

Compositionally and structurally it looks something like this.

- Description and analysis of the current situation, *i.e.*, description of the set and alignment of interacting forces-factors-constituents-components (regardless of whether it concerns the reorganization of the Rabkrin, the situation at the front, the organization of socialist competition, etc., etc.).
- Identification of directly interacting forces-factors-constituents-components and their "combination" into the main relation (at this step, the separation of the essential from the non-essential is actually performed).
- Identification and highlighting of the active (leading) and passive (driven) components within the established relation.
- Assessment of the established correlation of the mentioned components in the relation composed of them and determination of the vector (orientation) of probable change-movement-development of both individual components and the integral relation.

- Forecasting of event development: on the basis of the assessment made, the change of existing forms and the emergence (appearance) of new forms of reality is anticipated (predicted).

Thus, every time after analyzing the established state of affairs and alignment of forces, Lenin determines, firstly, with specific further steps towards achieving immediate goals and, secondly, with an assessment of the strategic perspective of the development of the situation as a whole.

That is why each such article turns out to be not just a beautiful dialectical twist (decorative icon), but a guide to action; each of his articles contains a description of a way out of the current situation and a transition (possibly with a leap) to a new turn-level of development of interacting elements, and in each article without exception the author offers his original and effective solution to the problem under consideration.

All of Lenin's forecasts are made on the basis of correctly composed relations from interacting sides-components of reality and also based on anticipating the trend or orientation of subsequent *contentful* filling of these relations. At the same time, the more accurately the sides-components directly opposing, confronting and interacting with each other are identified, the more correct and reliable the predictions of further development of events and situations turn out to be.
Of course, conditions, circumstances and forms interacting in the present differ from those of the past, but the principle (algorithm, "mechanism") determining the development of reality is invariant over time; that is why the proposed scheme or methodology of effective research into the surrounding world resembles the one presented above.
Below we will analyze all this using examples of well-known theoretical works by V.I. Lenin relating to three different periods of his life: *pre-revolutionary*, *immediate pre-revolutionary* and *post-revolutionary*.
[We should only additionally note that square brackets scattered throughout the text contain references to literary sources (as is usually done), as well as notes, explanations and comments (including comments on comments) by the author of this article].

§ 1. Works of the pre-revolutionary period

We will examine the dialectical background of Lenin's works from the pre-revolutionary period (which began a dozen and a half years before the Great October Socialist Revolution) using such Leninist works as "What Is to Be Done?", "One Step Forward, Two Steps Back", "The Beginning of the Revolution in Russia", "Marxism and Revisionism" and "On the Road", united by a single internal logic and canvas of corresponding historical events.

1. In his book "**What Is to Be Done?** Burning Questions of Our Movement" [8, pp. 80–236], published in March 1902, Lenin presented an overview of the initial stage of the revolutionary movement in Russia. The book was written during the

acute struggle for the creation of a revolutionary Marxist party of the Russian working class and played an outstanding role in the formation of the party.

In this work, Lenin identifies three stages and accordingly — three periods in the development of the revolutionary movement in Russia.

He describes the first stage of 1884–1894 as the embryonic development of social democracy carried out separately from the labor movement.

Regarding the second stage of 1894–1898: "social-democracy appears on earth as a public movement, as an upsurge of popular masses, as a political party" [8, p. 227]. Alongside and instead of "going into the people", there began a flow of intelligentsia toward workers (as the most active force-component of the future revolutionary movement) and widespread fascination among workers with strikes. However, this same strike struggle for the sake of increasing its own efficiency forced them to learn, read illegal literature, as well as diligently engage with issues of legal populism without forgetting at the same time about Marxist theory and the task of overthrowing autocracy. "The establishment of the party in the spring of 1898 was the most vivid and at the same time last act of the Social Democrats of this stripe" [8, p. 228].

The third stage finally replaces the second one starting in 1898. It is a period of confusion, vacillation, disintegration. The leaders of the movement were afraid to move forward (to political struggle), yielding to the strength of the spontaneous upsurge of the popular masses. The slogan "class struggle" did not push towards ever broader, more energetic activity but served as a means of appeasement: after all, everyone knows that "economic struggle is inextricably linked with political". The idea of the party did not serve as a call to create a combat organization of revolutionaries but justified some kind of "revolutionary bureaucracy", childish playing with "democratic" forms. And here, in this connection, the author, like a true scholar drawing conclusions only based on facts (without fabrications or fantasies), having difficulty saying when the third stage will end and the fourth begin, nevertheless expresses firm confidence that the fourth stage will lead to strengthening militant Marxism; that the rear-guard of conciliators and deserters will be replaced by the actual vanguard of the most revolutionary class (proletariat), which will manage to overcome uncertainty, hesitation and lack of confidence in their own forces. And then (in terms of calling for such a change and summarizing what has been said), it becomes possible to give a concise and exhaustive answer to the question "what is to be done?" — liquidate the third stage (period of confusion, vacillations, hesitations and lack of confidence in one's own forces) [8, p. 229].

[Thus, Lenin outlined here the objectively occurring successive replacement of stages (forms) of substantive revolutionary movement expressed qualitatively and quantitatively through changes in the correlation between the *contentful* and formal components in the known relation {proletariat/bourgeoisie}. The correlation of components (within the specified relation) changes with the growth in share and importance of the active revolutionary component (proletariat) due

to increased *contentfulness* conditioned by the influence of the following accompanying factors: emergence of social democracy => becoming established of social democracy => unification of social democratic formations on the basis of the idea of creating a Marxist proletarian party => establishment of the Bolshevik Party of the Russian working class as its most revolutionary vanguard. This entire chain of transforming factors directly affected the numerator of the aforementioned relation (*i.e.*, the "proletariat" component), raising its *contentfulness* within the whole relation.

In other words, Vladimir Ilyich, with impartiality of a scientist, stated that for the period from 1884 to 1898 and further (later) there took place and continues objective movement (transformation, transmutation) of the *contentful* component of the mentioned relation towards increasing its *contentfulness* while simultaneously upsetting equilibrium in the relation {proletariat/bourgeoisie} in favor of strengthening and predominance of influence of more *contentful* active proletarian forms of movement over more conservative bourgeois ones. An innate ability and predisposition for dialectical thinking allowed Vladimir Ilyich to break down step-by-step the phase-wise and periodic nature of the revolutionary struggle, identify the active and passive forces-components of the revolutionary movement in Russia of that time, trace their genesis and determine measures to activate and strengthen the *contentful* proletarian component (which meant overcoming uncertainty, hesitation and lack of confidence inherent in socialist-democratic circles and organizations "nourishing" the *contentfulness* of the "proletariat" component). There is also a source of replenishment of the *contentfulness* of the "proletariat" component, which at that time consisted of the educational standard of the bourgeois intelligentsia].

2. The continuation of the struggle for cleansing the revolutionary movement and its vanguard (the Marxist party) from its wavering members (random elements) is described very vividly by Lenin in the book "**One Step Forward, Two Steps Back** (Crisis in Our Party)" [8, pp. 237–421]. The book resulted from Lenin's thorough study and analysis of numerous protocols of meetings and resolutions of the II Congress of the RSDLP and was released in May 1904. In this work, Vladimir Ilyich shows how something big, main and essential eventually emerges and takes shape from small things (seemingly insignificant matters, squabbles, disputes, discussions and quarrels serving as signs of fierce clash of opinions and different points of view). The art of a great dialectician manifested itself in this case in recognizing this essential thing — the role and significance of organizational issues in the process of forming the core of the revolutionary movement (*i.e.*, the Bolshevik Party), as well as timely demarcation from conciliators and wavering elements regarding principal questions, attracting to one's side by polemic and persuasion the majority of potential sympathizers. As a result of this struggle, the idea emerged of establishing and organizing a monolithic nucleus of the labor movement — the Bolshevik Party — in opposition to amateurishness and circle-mindedness characteristic of the social-democratic movement. Without consolidation around a single center, without subordination to decisions of this center (that is, without

iron discipline), the future conquests of the Great October would have simply been unthinkable and impossible. Precisely from the standpoint of the dialectical approach (from beginning to end), Lenin conducts his painstaking analysis of the accompanying events of this struggle. For the proletariat (and any public association alike) there is no other weapon in the struggle for power except **organization** (*organized effort*) — writes Lenin. The proletariat can become an invincible force only because the ideological unity of its theoretical principles (first of all, Marxist theory) is secured by material unity of organization uniting millions of workers into a single army (of the working class). Before this army, the decrepit power of international capital will not stand. This army will draw closer and tighter ranks despite any zigzags and steps backward [8, p. 413].

In the course of detailed study of the background of this issue, Lenin draws attention to the fact that every development indeed proceeds along a dialectical path of resolving emerging contradictions: minority becomes majority, majority becomes minority, each side moves from defense to attack and from attack to defense; the original point of ideological struggle is "negated", but then begins "negation of negation" and the struggling sides return to the original point of purely ideological struggle, but now this "thesis" is enriched by all the results of the "antithesis" and turns into a higher "synthesis"; when an isolated random error has grown into a quasi-system of conciliatory views on the organizational issue, and the erroneousness of such an approach becomes increasingly apparent. "In short, not only oats grow according to Hegel, but Russian social-democrats fight among themselves too according to Hegel," concludes Vladimir Ilyich [8, p. 410].

[It is extremely important to note that the dialectical character of formulating various conclusions and findings through "piling up" and layering of minor questions and discussion results upon each other or through "returning to oneself at a new level" is recorded by the author as self-evident.

Of course, for us living today, concepts and terms like "proletariat", "bourgeoisie", "classes", "class struggle", etc., seem antiquated and exotic. At the same time, forgetting the terminology of the past does not mean liberation from the elements of developing reality denoted by it. After all, the class structure of society still persists, whatever anyone says: on the one hand — hired labor, on the other — financial-industrial capital (generally speaking, "oligarchy"). And only the most shameless liar risks claiming that everything in such a public arrangement is "even". That is why the meaning of the phrase "class struggle" nowadays differs little from the content of this terminology in the examined pre-revolutionary times, and the concept of "class struggle" is unlikely to disappear until the notion of "classes" fades away. Therefore, even today it remains important (and perhaps even more so) to be able to find interacting components (competing, conflicting, confronting sides) and correctly compose relevant *content-form* relations (of the type {content/form}) in order to properly define directions of variability both of the components themselves and of their relations as a whole (i.e., of social systems and structures), distinguish and

separate the essential from the secondary (less significant) and thereby predict changes in existing forms and the appearance of new ones. All this, undoubtedly, may assist in devising the most effective forms of class struggle, etc. Applying to today's situation, the terms in the relation {proletariat/bourgeoisie} can be replaced by terms: {hired labor/capital}, {class of non-propertied/class of owners of means of production}, etc., without loss of meaning. Our current capitalists and bourgeois are "blown-up", random, staged characters whose state and public property on the means of production fell into their private hands as a result of unprecedented manipulations and machinations, fraud and raiding (people's memories are still fresh enough about how the initial capital was acquired and accumulated during the uncontrolled descent of the collapsing country into the quagmire of wild capitalism) — and therefore they receive no respect, reverence or trust from the people or representatives of hired labor.

It is enough to look more closely to see the same standard scheme serving as the framework for the overwhelming majority of public (socio-economic) formations: hired labor on one side and capital on the other. The "court" philosophers, economists and political scientists (just like in Lenin's pre-revolutionary times, servicing similar power structures and institutions, feeding from their hands, and imposing an opinion about the accomplished reconciliation of possessing and non-possessing counterparts) invented (no doubt, out of thin air) some kind of "middle class"; although any schoolchild knows that there existed before and still exist today two main classes differing **by their relation to ownership of means of production**, with a bourgeois stratum of small commodity producers cushioning this entire "construction" between them. The reader probably understands that at the current stage of social development, the arsenal of tools for production and reproduction has significantly expanded and, besides traditional ones, now includes land, dams, roads, overpasses, vehicles, communication facilities, computers, printing and information dissemination media, instruments for managing financial flows, various robotic complexes, systems with artificial intelligence, etc., etc. Apologists of homogeneity and uniformity of modern social arrangements could be advised to pay attention to how the current coronacrisis instantly stripped off the lacquered drapery and glittering tinsel from the appearance of the vast majority of representatives of the so-called "middle class" (for example, in the USA), leaving behind only debt credit obligations and nothing resembling substantial property (in the form of means of production, capitals, financial assets, fixed and working capital, etc.).

In any conflict, war or internal catastrophe manifested externally, its inner core ultimately turns out to be a dispute and confrontation of *Contentful* and formal constituents. And what these constituents are clothed in (what forms they take) — this becomes the subject of skillful analysis and recognition; here one must be able to correctly formulate (compose) a relation from interacting components: whether it is {hired labor/capital}, or {class of dispossessed/class of owners of means of production}, or {liberals/conservatives}, or {productive forces/production relations}, or

{public character of production/private-capitalist mode of appropriation}, or {transnational (global)/national economy} and so on.

Carrying out further analysis of variability, say, of the last relation listed above, one cannot fail to notice that at today's stage of development the component "national" represents a fairly stable side of the relation {transnational/global/national}; hence the noticeable and strong resistance (opposition) of this component relative to its opposite — the component "transnational". However, subsequently the correlation of components in this relation will inevitably change due to increased efficiency (*i.e.*, *contentfulness*) of the numerator component, and trans-national will prevail over nationally-state just as the public (socialized) will find itself in a better position compared with private (privatized) in the relation {public/private}, which will correspond to the law-governed increase in *contentfulness* (efficiency) of these form-relations. Cost reduction, market expansion and other optimization characteristic of transnational (and in perspective — socialized) economy to a greater extent than national-state economy will lead to growth in *contentfulness* both of the numerator component of the considered relation and of the whole relation. In such connection, it is fascinatingly interesting to follow the intricate flow of Lenin's thought flowing from less *contentful* preceding conceptual construction into a more *contentful* and capacious conceptual formation, and to see that the spirit and manner of thinking of the great dialectician is akin to the process of *contentful* layering, similar to rolling up a "snowball", and remains essentially unchanged from article to article. Compositionally, this looks exactly like this: description of the initial situation and existing state of affairs; statement of alignment of forces; identification of objective prerequisites and trend towards changing the correlation of forces and the overall situation; prognostic description of prospective or succeeding new form-relation (or system of forms) and ways of its emergence].

3. The article ″**The Beginning of the Revolution in Russia**″ [8, pp. 422–424] was written by Lenin in January 1905 — almost immediately after the events of Bloody Sunday in St. Petersburg. Judging by the fact that the spring was slowly compressing ("the tsarist government deliberately gave relatively unhindered development to strike movements and the beginnings of broad demonstrations"), it was not difficult to assume that the government acted with the intention of driving things toward the use of military force [8, p. 422]. As a result: thousands killed and wounded. The Rubicon has been crossed: the compressed-to-the-limit spring had to release its accumulated energy — the proletariat rose up and began to arm itself. And immediately the entire palette of revolutionary appeals, slogans and actions changes. The rebellious Petrograd workers put forward demands for immediate convocation of a constituent assembly based on universal, direct, equal and secret suffrage, as well as for the immediate overthrow of the government; at the same time, "arming the people becomes one of the nearest tasks of the revolutionary moment." Events develop with astonishing speed: "the revolutionary education of the proletariat advanced in one day

more than it could have done in months and years of gray, humdrum, downtrodden life". Immediate arming of workers and all citizens generally (it was recognized and pointed out that revolutionaries of bourgeois democracy could be used for the overthrow of Tsarism), "preparation and organization of revolutionary forces for the destruction of governmental authorities and institutions — this is the practical basis upon which all and any revolutionaries can and should combine for a common blow" [8, p. 424].

[It should be noted here that there are no Councils of Workers', Soldiers' or Peasants' Deputies yet on the forefront of the growing struggle. The situation develops exclusively within the framework of the relation composed ("formed") of directly interacting components {proletariat/autocracy}: on the one side — the working class under the wing of the Social-Democratic Party; on the other side — autocracy with its coercive institutions].

And no matter how the present uprising ends in St. Petersburg itself, it will inevitably and necessarily become the first step toward a much broader, more conscious, better-prepared uprising. The government may manage to postpone the hour of reckoning, but postponement will only make the next step of the revolutionary onslaught even grander [8, p. 423].

[This example clearly demonstrates how V.I. Lenin masterfully formulated and "calibrated" the previously reproduced dialectical scheme: precise identification and definition of interacting constituents-components in their relation {organizing proletariat/institutions of autocratic power}; identifying the active component in this relation; determining the direction of variability (movement, development) of the active component and the whole relation; forecasting the emergence, accordingly, of new *contentful* forms as a result of this change-movement.

Human thought always tends towards representing (expressing) its most perfect form of maximum content volume. Structurally-compositionally, the same scheme looks like this: description of the established situation in conditions of disequilibrium; identification of causes and backgrounds contributing to disruption of situational equilibrium; description of the process of situation development while moving it towards a more equilibrated, more balanced state; description of the new state of affairs and newly emerging situation replacing the existing one due to inevitable ongoing changes].

4. The article "**Marxism and Revisionism**" [8, pp. 36–43] was written in March-April 1908. Describing the initial starting position, Lenin draws attention to the alignment of forces (*i.e.*, lists interacting components) in the course of the struggle unfolding in the theoretical sphere. In this sphere, newly emerged natural-historical theories in the mid-19th century, touching old theological prejudices, caused and continue to cause the fiercest opposition and struggle [8, p. 36]. Bourgeois scientific thought and philosophy do not want to hear anything about Marxism, declaring it refuted and destroyed [how wonderfully "fresh" and

recognizable is such an attitude toward Marxism even today!]. The increasing role of Marxism and consolidation of its ideas among the working class inevitably provokes sharpening bourgeois attacks against Marxism, which after each "destruction" by official science becomes stronger, tougher and livelier. Having defeated and outplayed many hostile external currents over the past fifty years, today Marxism faces opposing currents requiring its correction within Marxism itself. Pre-Marxian socialism remains strong in Russia and sometimes revives. Generally speaking, pre-Marxian socialism has been broken, but it continues fighting not on its own independent ground but on common Marxist ground — as revisionism [trying to legalize and prove viability of a mixture of "a bulldog with a rhinoceros"]. Essentially, however, all this petty-bourgeois revision of Marxism (revision of small shopkeepers) always boils down to negation or diminution of the factor of class struggle and channeling class struggle into the stream of "class cooperation" [8, pp. 38–39].

What accounts for the inevitability of periodic revival of revisionism and its roots under capitalism? It lies in the fact that in any capitalist country there are always broad layers of petty bourgeoisie, small proprietors alongside the proletariat. Capitalism was born and constantly reborn (regenerated) from small production [8, p. 42]! A whole series of "middle strata" [by analogy with some "middle class", using modern language] is inevitably created again and again by capitalism due to its inner necessity (services of individual craftsmen, home-based work, small workshops serving large industry, etc.). When they go bankrupt, these small producers are inevitably thrown back into the ranks of the proletariat, "diluting" their views and beliefs with petty-bourgeois worldview, their ideology (which, apparently, requires constant work on retraining and re-education). This is completely natural and will be so for a long time while antagonistic classes exist. And ideological struggle of revolutionary Marxism with revisionism is merely the prelude to great revolutionary battles of the proletariat until complete victory of its cause despite all vacillations and weaknesses of the petit bourgeoisie [8, p. 43].

Bypassing superficial phenomena (effects), Lenin constantly brings to light the most essential, profound sides-components consisting in actual relations of interaction and confrontation. Thus, contrary to the widespread opinion among revisionists, he states that growing parliamentarism and education of the proletariat do not weaken crises and eliminate revolutions but, on the contrary, contribute to intensifying civil war during these crises and revolutions [8, p. 41]. They (parliamentarism and education) help enlighten and organize ever larger masses of population correspondingly to the increase ("piling up") of substantive (informational) accumulations. This constitutes the internal dialectics of parliamentarism and bourgeois democratism, subordinate following of which expresses itself in even more acute than before resolution of disputes and contradictions through mass violence.

[Lenin is a master at identifying dialectically confronting components (*i.e.*, the most interconnected and substantially conflicting sides, speaking in everyday terms) in all episodes of development of reality that he analyzes. In this case,

according to the established circumstances, he identifies the main actively interacting components of development (of the revolutionary movement): Bolsheviks on one side, Mensheviks on the other. Ideological grounds or background guiding the interacting parties are: revolutionary Marxism on the one hand, and revisionism on the other. Material carriers of these sides turn out to be the revolutionary proletariat on one side and wavering petty-bourgeois middling elements on the other. At later times, the latter would give way to bourgeois intelligentsia (unsteady, eternally vacillating and conciliatory). Then Lenin identifies the active *contentful* component, anticipates the direction of its change-movement, and further forecasts the orientation and priority of subsequent movement-development of the entire system composed of the considered components together with other changing factors of political reality].

5. The transient nature and finiteness of prosperity of any form (whether among forms of economic management or among forms of revolutionary movement) is evidenced by the periodic renewal of crises (industrial, economic, financial, political, social, etc.).

The reason for writing the January 1909 article ″**On the Road**″ [8, pp. 537–544] was the organizational and ideo-political crisis in the Social-Democratic Party of Russia. The background of the crisis lay in the urgent need to cleanse the "workers' party of wavering, intellectual and petty-bourgeois elements who had joined the labor movement mainly hoping for the imminent triumph of the bourgeois-democratic revolution and who could not hold out during the reaction" [8, p. 538]. The instability of these "elements" affected both theory, tactics and organizational policy of the party. Conscious workers took charge of running party organizations and leading them. The situation required convening the All-Russian Conference of the RSDLP, where answers were actually formulated regarding what path the working-class party should choose in the difficult current period.

The content of this answer consisted of the following decisions and developments of the conference: "Marxist analysis of the current relationship between classes and new policies of Tsarism"; indication of the immediate goal of struggle set by the Social-Democratic Party; "assessment of lessons learned from the revolution concerning the correctness of revolutionary-social democratic tactics; clarification of causes of the party's crisis and pointing to the role of the proletarian element of the party in combating it; resolving the issue of the ratio of illegal and legal organization"; recognition of the need to use the Duma tribune and development of precise guiding instructions for the social-democratic faction in connection with direct criticism of its errors [8, p. 538].

Autocracy [instead of the term "autocracy", one can use today's equivalents (terms closest and similar in meaning are): authoritarianism, autocracy, tyranny, despotism] still acts as the main enemy of the proletariat and all democracy, but it would be a mistake to think that it remains unchanged, does not change or mimic. Today "autocracy attempts to take upon itself the solution of objectively necessary tasks of the bourgeois revolution — creation of popular representation

truly governing affairs of bourgeois society, and cleaning up medieval, tangled and obsolete agrarian relations in the village; but precisely the practical result of these new steps of autocracy turns out so far equal to zero, and this only makes even clearer the necessity of other forces and means for solving the historical task" [8, pp. 539–540].

New conditions of the moment require new forms of struggle: using the Duma tribune appears an unconditional necessity; long-term work on education and organization of masses of the proletariat is moved to the forefront; combining illegal and legal organization presents special challenges to the party; popularization and explanation of the experience of the revolution discredited by liberals and liquidator intellectuals are needed both theoretically and practically. But the tactical line of the party, which must manage to account for new conditions in methods and tools of struggle, remains unchanged. The correctness of revolutionary-social democratic tactics has been confirmed by the experience of mass struggle of 1905–1907. The defeat of the revolution at the end of this first campaign revealed not incorrectness of goals, not utopian nature of objectives, not erroneousness of means and approaches, but insufficient preparedness of forces, insufficient depth and breadth of the revolutionary crisis. Let liberals and bewildered intelligentsia fall into despair after the first massive battle for freedom. Conscious proletariat will respond to them that great tasks of revolutions were solved only when advanced classes repeated their onslaught more than once and achieved victory, having been taught by the experience of defeats. Defeated armies learn well. Revolutionary classes of Russia have been defeated in the first campaign, but the revolutionary situation persists. [Lenin's inexhaustible optimism calling to learn also from defeats evokes nothing but admiration!!!]. In new forms and another way, the revolutionary crisis looms again, matures again [it is known that any crisis always precedes and ends with replacement of forms representing developing contents of reality]. Long-term preparation of broad masses — preparation taking into account higher and more concrete goals — should be carried out, and the more successfully it is done, the surer the victory in the new struggle will be. And the same proletariat will now be able to patiently and steadfastly carry out the work of educating and preparing new cadres of a mightier revolutionary force.

[It concerns periodic evaluation of the correlation of interacting components in their relation and constant tracking of the trend of shifting this correlation towards increasing and predominance of the more *contentful* component, for which the *contentfulness* of the active component (i.e., the revolutionary spirit of the proletariat) must be "replenished" through popularization and elucidation of the experience of mass struggle and revolution].

Since the general link diluting and weakening Marxist ideology of the proletariat continues to be the small commodity producer (petty bourgeoisie), drifting between two clearly defined classes of capitalists and proletariat, then under such circumstances the task of the day is: "Strengthening of the illegal party organization, creating party cells in all areas of activity, creating above all purely party, albeit few-membered workers' committees in every industrial enterprise,

concentration of leading functions in the hands of leaders of the social-democratic movement from among the workers themselves" [8, p. 543].

Each cell and each party worker committee must become a support point for agitational, propaganda and practically organizational work among the masses, *i.e.*, necessarily go where the mass goes and try at every step to push its consciousness toward socialism, winning for itself leadership in all proletarian legal organizations by virtue of its energy and ideological influence (rather than titles and ranks).

[According to the testimony of N.V. Volsky (a contemporary of Vladimir Ilyich, with the real surname N.V. Valentinov), who never was, by his own admission, either a Bolshevik or a pronounced Menshevik [1], Lenin was a supporter of the agitational work with all strata of the population, but the emphasis proposed to be made nevertheless on the work with the proletariat of Russia.]

In any case legally or semi-legally, openly or covertly, the working class will find points of consolidation everywhere — conscious party social democrats will always move ahead and consolidate among themselves to impact the masses in the party spirit.

A party of the vanguard class (proletariat), which manages to organize its avant-garde and direct its forces so as to exert social-democratic influence on every manifestation of life of the proletariat — this party will win no matter what [8, p. 544].

[By analogy with the previous article, V.I. Lenin bases his analysis of current events again on the existence and interaction of two main classes: the ruling class of owners of means of production and the subordinate class of non-propertied, dependent hired laborers free from ownership of means of production. Between these two classes drifts a layer of declassified petty-bourgeois elements, periodically replenishing either class (much more often — the class of non-propertied hired laborers). The cause of the ideological-political crisis in the Russian Social-Democratic Party was exactly the uncertainty of position of representatives of this stratum within the social-democratic milieu. All other conclusions and fabrications stem from evil, belong to the realm of fictions generated by apologists serving the ruling class among university professors, professional philosophers, political scientists and propagandists of all stripes.

Neither Marx nor Lenin were discoverers of classes or originators of ideas about class struggle as the driving force of social development — bourgeois historians and economists had "exploited" these discoveries long before Marxism emerged. But both used primarily these concepts and representations to analyze ongoing historical processes, their patterns and trends.

Then came times when the aforementioned concepts (denoting the main subjects of social activity and the process of its implementation) were buried

under splinters and chips flying from the axe that carried out major public transformations. Thus, the most important components of development and their sacramental relations were put away in a drawer for a long time and thoroughly forgotten.

Nowadays it is quite common to hold an opinion — usually expressed by the same "court" politicians, economists and philosophers close to power structures, as well as their media outlets justifying the fairness and eternity of existing foundations, *i.e.*, apologists of current social arrangements — that class theory has hopelessly become obsolete and that now property ownership itself (especially on means of production) plays no role; supposedly, what matters today are opportunities to control financial flows.

No, gentlemen, you are wrong. In order to manage financial flows, play multi-step financial combinations, rule over the whole world, etc., you still have to eat, drink, live somewhere, "manage households, give birth to children, produce products, exchange them..." (see the above-quoted Lenin passage from the book "Materialism and Empiriocriticism"), which does not allow ignoring property relations and everything connected with them. And if you want to rise higher, soar above earthly life with its material physical side — this will not happen either. To realize such a "wish", one would have to completely detach oneself from the objectively-material level of one's bodily-intellectual organization, from the basis of your precious "I", which is absolutely impossible without loss or deprivation of this unique "I". The level of ideal subjective forms enters only narrowly (although being the most *contentful* of reliably known ones today) into the overall set of levels constituting your "I", whereas the bulk of every human "I" consists of rather "down-to-earth" object-matter layers of reality. And you cannot get rid of the heavy shackles of these "coarse" layers while remaining among those living on earth. This is precisely what Marx called, recalling his words, the curse on spirit — to be burdened by matter. And however much anyone might wish, having achieved desired material prosperity, to dissociate themselves from all coarse physicality and ascend to the realm of the ideal and unearthly — property relations and especially those regarding means of production will continue to remain **key**, whoever says otherwise and however they try *to camouflage* this fact. Therefore, staying on real ground and being part of the object-matter level of reality forming and filling you up, you will inevitably have to keep fighting for your flesh and for your place under the sun. You will also inevitably have to think about your offspring, and in connection with this — about inheritance for your descendants, *i.e.*, about that very mundane property which, god forbid, may end up in alien hands. Your own flesh will not let you soar above the struggle and beyond this entire world like an elf or angel; but once you shed it (if such should ever occur), you will simultaneously lose yourself (your "I") together with all your "fantasies" and "desires" — well, then what will your desires concern?

The direct path for you, gentlemen, lies toward **socialism** — there alone will you find deliverance from unbearable fetters of property and endless

thoughts about accumulation and transfer of material inheritance into the right hands, and finally begin caring about intellectual and spiritual legacy; there you will acquire more or less genuine freedom from dreary thoughts about how to master financial assets, ride financial flows — and who knows what else you cling to with iron grip. Welcome to socialism, gentlemen!

It must be said that denial of classes and class struggle is an inexhaustible element of idle reasoning exercises, periodically reviving and again taking possession of unsophisticated minds after each successive "defeat" and public expulsion. It seems, however, that the hour has come when public attention is drawn again to relations of key constituents of developing reality, as well as to their role and significance during replacement of forms of social progress. The mere absence at present of visible signs of class struggle speaks only of disorganization or insufficient organization of representatives of hired labor and lack of outstanding and incorruptible leaders of revolutionary movement at this stage of social development.]

In relation {proletariat/autocracy (tsarism)} a fairly noticeable shift occurred towards predominance of the fastest-developing *contentful* component — proletariat with its Marxist party, becoming richer in content due to growth in educational standard of party and proletarian ranks, while the second component — autocracy — mimics, tries to mask itself as bourgeoisie and merge with it. It should be noted that in his analysis Lenin never considers the main interacting components or figures separately, detached from each other — always only together, in interaction, in relation. Proletariat is nonessential without bourgeoisie or capitalists, just as the latter are nonessential without proletariat. Capital is nonessential without hired labor, and vice versa. Only the interaction of these two constituents of reality, their collision, their conflict, internecine struggle contributes to emergence of new developmental forms and movement toward a new socio-economic formation, *i.e.*, to new forms of acquiring social orders.

[Periodically arising public conflicts have as their foundation accumulating unsolvable-for-the-time-being *content-form* contradictions: between outdated management system, bureaucratized power, "bourgeoisified" ruling class with its institutions and forms of governance on the one hand, and, on the other hand, competence and preparedness of society with its substantive public opinions and representations surpassing this "ossifying" system. Evidence of this includes numerous examples of modern states with their internal conflicts: frames, forms, methods of primitive management do not meet the needs, demands, requirements of a complexifying, perfecting, developing and rapidly increasing-in-*contentfulness* socium.]

A crisis in the revolutionary movement (according to Lenin) is a harbinger of another stage of construction and formation of a new relation of directly interacting constituents-components and at the same time a precursor of a new search for a way "on the road" and purification from the old form (its attributes) restraining the movement of the *contentful* constituent; it is a

sign of outgrowing the existing form by its developed content and an indicator of necessity to master a new promising form sufficiently developed already in terms of content. At the same time, the correlation of constituents-components in the newly emerging and changing relation is analyzed, where the numerator is enriched by decisions and conclusions of conferences and congresses of the Bolshevik Party, while the denominator is fed by resolutions of the Constituent Assembly of the State Duma (*i.e.*, circulars of the "mimicking" form of state government).

[Production, management, economic, ideological-political, etc., crises are indicators of a disrupted balance or equilibrium between interacting components in their various form-relations. The leading *contentful* constituent moving forward (or preparing to move forward and lead) "requires" search for and discovery of its corresponding formal component that balances (for some period of time) the combined relation of these constituents. The stagnant phase in which this new disequilibrium relation finds itself (in our case: {educated proletariat/mimicking autocracy}) is overcome by searching for and finding a more active form of movement of the *contentful* component, which, when another way out "on the road" is found, is ensured through accelerated increase in *contentfulness* of the numerator of the mentioned new relation; *i.e.*, through (in Lenin's words): indication of the immediate goal of struggle; assessment of correctness of social-democratic tactics; clarification of causes of the party crisis and pointing to the role of the proletarian element of the party in combating it; resolution of the issue regarding the ratio of illegal and legal organization; recognition of the need to use the Duma tribune and development of precise guiding instructions for the social-democratic faction.]

And, as Lenin summarizes, this stage must be outgrown and the crisis overcome by discovering and applying new forms of struggle [8, p. 540].

In other words, a new exit "on the road" is sought through increasing the *contentfulness* of forms of the Social-Democratic movement.

§ 2. Works of the immediate pre-revolutionary period

The second period, which we have named as **immediate** pre-revolutionary (on the eve of the revolution), is represented by a number of works by Vladimir I. Lenin, dictated by rapidly changing events (especially on the eve of the October coup).

1. In the book "**On the Right of Nations to Self-Determination**" [8, pp. 569-621], written in May 1914, Lenin analyzes in detail the specifics of applying the Marxist position on the secession of nations depending on different historically established conditions for the formation of one or another nation.

Due to its closest connection with the present, we will dwell on this work in more detail.

Preliminarily, it should be said that the "right of nations to self-determination", regarding the legitimacy and expediency of whose proclamation and protection heated debates do not cease even in our days, is not a figment of V.I. Lenin's imagination or an invention of the Bolsheviks, but the result of discussions and decisions of the International congresses, and in particular the "London International Congress (of socialist workers' parties and trade unions) of 1896". The defense of this right and its inclusion in the program of the Social-Democratic Party of Russia was justified by Lenin by referring to the corresponding stage of the national liberation movement experienced by Russia. By analogy with the support by Marxists under similar historical conditions of the said right in Western Europe, Lenin, focusing on similar liberation processes in Eastern Europe and Asia (including Russia), but occurring with some delay (at least by half a century), concludes on the necessity of advancing the same demand at the stage of revolutionary transformations in Russia as well.

To convey the logic of Lenin's thought, let us provide a chain of characteristic quotes from this work.

"An unconditional requirement of Marxist theory in the analysis of any social question whatsoever is to place it within definite historical limits, and then, if the question concerns one country (for example, a national program for a given country), to take into account the concrete specifics distinguishing this country from others within the limits of one and the same historical epoch" [8, p. 574].

"The comparison of the political and economic development of different countries, as well as their Marxist programs, is of enormous significance from the standpoint of Marxism, for both the general capitalist nature of modern states and the general law of their development are indisputable. But such a comparison **must be made skillfully**. The ABC condition here is to clarify the question of whether the historical epochs of development of the compared countries are comparable" [8, p. 578].

"In Western, continental Europe, the era of bourgeois-democratic revolutions covers a rather definite time span, approximately from 1789 to 1871. It was precisely this era that was the era of national movements and the creation of national states. Upon the completion of this era, Western Europe turned into an established system of bourgeois states, as a general rule, at the same time nationally unified states. Therefore, to now seek the right to self-determination in the programs of West European socialists means not to understand the ABC of Marxism.

In Eastern Europe and Asia, the era of bourgeois-democratic revolutions only began in 1905. ...And in this chain of events only a blind man can fail to see the awakening of a whole series of bourgeois-democratic national movements, aspirations for the creation of nationally independent and

nationally unified states. **It is precisely because and only because Russia, together with neighboring countries, is experiencing this era that we need a point on the right of nations to self-determination in our program**" [8, pp. 578-579].

"Thus, **it is the historical concrete specifics of the national question in Russia that give us a special urgency to the recognition of the right of nations to self-determination in the epoch we are experiencing**" [8, p. 581].

"The bourgeoisie, which naturally acts as the hegemon (leader) of any national movement at its beginning, calls the support of all national aspirations a practical matter. But the policy of the proletariat in the national question (as in other questions) only supports the bourgeoisie in a certain direction, but never coincides with its policy. ...Every bourgeoisie wants in national matters either privileges for its nation or exclusive benefits for it; this is called 'practical'. **The proletariat is against any privileges, against any exclusivity**" [8, p. 582].

"The bourgeoisie always places its national demands in the foreground. It puts them unconditionally. For the proletariat, they are subordinated to the interests of the class struggle. Theoretically, one cannot guarantee in advance whether the secession of a given nation or its equal status with another nation will complete the bourgeois-democratic revolution; for the proletariat, it is important in both cases to ensure the development of its class; for the bourgeoisie, it is important to hinder this development, postponing its tasks before the tasks of 'their' nation. Therefore, the proletariat limits itself to a negative, so to speak, demand for the recognition of the right to self-determination, **guaranteeing nothing to any nation, undertaking to give nothing regarding another nation**.

Let this be not 'practical', but in fact this most reliably guarantees the most democratic of possible solutions; the proletariat needs only these guarantees, and the bourgeoisie of each nation needs guarantees of its benefits without relation to the position (to possible minuses) of other nations.

The bourgeoisie is most interested in the 'feasibility' of a given demand — **hence the eternal policy of deals with the bourgeoisie of other nations to the detriment of the proletariat**.

Let this be not 'practical' for opportunists, but this is the only guarantee in fact, a guarantee of maximum national equality and peace in spite of both the feudal lords and the nationalist bourgeoisie.
The entire task of the proletarians in the national question is 'impractical' from the standpoint of the nationalist bourgeoisie of each nation, for the proletarians demand abstract equality, the principled absence of the slightest privileges, being hostile to any nationalism.

...The proletariat is against such practicality: recognizing equality and equal right to a national state, it values and places above all the union of proletarians of all nations, evaluating any national demand, any national secession from the angle of the class struggle of workers. The slogan of practicality is in fact merely the slogan of uncritical adoption of bourgeois aspirations.

They tell us: by supporting the right to secession, you support bourgeois nationalism of oppressed nations. ...We answer: no, it is precisely the bourgeoisie that is interested in a 'practical' solution here, while for the workers it is important to fundamentally distinguish two tendencies. Since the bourgeoisie of the oppressed nation is fighting the oppressing one, we are always and in any case and more resolutely than all, for we are the boldest and most consistent enemies of oppression. Since the bourgeoisie of the oppressed nation stands for its bourgeois nationalism, we are against. **The struggle against the privileges and violence of the oppressing nation and no connivance at the striving for privileges on the part of the oppressed nation**.

If we do not advance and conduct in our agitation the slogan of the right to secession, we will play into the hands not only of the bourgeoisie, but also of the feudal lords and the absolutism of the oppressing nation. ...In every bourgeois nationalism of an oppressed nation there is a general-democratic content against oppression, and it is this content that we unconditionally support, strictly separating the striving for one's own national exclusiveness, fighting against the striving of the Polish bourgeois to oppress the Jew, etc., etc. [That is, here, undoubtedly, one must see the boundary markers beyond which the striving for national identity degenerates into inveterate nationalism and then into bestial Nazism, and suppress such a content-form transformation].

This is "impractical" from the point of view of the bourgeois and the philistine. This is the only practical and principled and truly helping democracy, freedom, and the proletarian union policy in the national question: recognition of the right of nations to secession for all; evaluation of each specific question of secession from the standpoint eliminating any inequality, any privileges, any exclusivity.

Let us take the position of the oppressing nation. Can a people that oppresses other peoples be free? No. The interests of freedom of the Great Russian population require a struggle against such oppression. A long history, a centuries-old history of suppressing the movements of oppressed nations, systematic propaganda of such suppression by the "higher" classes have created enormous obstacles to the cause of freedom of the Great Russian people itself in its prejudices, etc.

...The Great Russian proletariat cannot achieve its goals, cannot clear its path to freedom, without systematically fighting these prejudices.

[And the matter here, perhaps, is not only in prejudices or the moral-humanistic side of the issue, but also in the trivial discomfort of the everyday life of the oppressing nation, being in constant tension, suspicion, apprehensions and expectation of blows in the back from the oppressed, suppressed, humiliated nation.

The Great Russian, privileged in relation to a non-Russian, is just as unfree, uneasy, unbalanced, unself-sufficient as a non-Russian — due to the social tension created by the counter-resistance and opposition from the oppressed nation. This contentfulness ought to be known to today's "resolvers" of the national question].

...We, the proletarians, declare ourselves in advance to be opponents of Great Russian privileges and in this direction conduct all our propaganda and agitation... against all state-national privileges... such a task is our main (current) task in the national question, for only in this way do we defend the interests of democracy and the equal union of all proletarians of all nations.

Let this propaganda be impractical from the point of view of the Great Russian oppressors and from the point of view of the bourgeoisie of oppressed nations. ...In fact, it is this propaganda, and only it, that ensures a truly democratic and truly socialist education of the masses. Only such propaganda guarantees both the greatest chances of national peace in Russia if it remains a motley national state, and the most peaceful (and harmless for the proletarian class struggle) division into different national states, if the question of such a division arises" [8, pp. 582-586].

"To accuse the supporters of the freedom of self-determination, i.e. the freedom of secession, of encouraging separatism is the same stupidity and the same hypocrisy as to accuse the supporters of the freedom of divorce of encouraging the destruction of family ties. Just as in bourgeois society the defenders of privileges and venality, on which the bourgeois marriage is built, oppose the freedom of divorce, so in the capitalist state the denial of the freedom of self-determination, i.e. the secession of nations, means only the defense of the privileges of the dominant nation and police methods of administration to the detriment of democratic ones" [8, p. 593].

"The real class significance of the liberal hostility to the principle of political self-determination of nations is one and only one: national-liberalism, the defense of state privileges of the Great Russian bourgeoisie. [It is not difficult to see that the position of some leaders of the "liberal" parties of modern Russia is an absolute carbon copy of these Lenin's words].

...The interests of the working class and its struggle against capitalism require full solidarity and the closest unity of workers of all nations, require resistance to the nationalist policy of the bourgeoisie of whatever nationality. Therefore, a deviation from the tasks of proletarian policy and the subordination of workers to bourgeois policy would be both if the Social-Democrats were to deny the right to self-determination, i.e. the right to secession of oppressed nations, and if the Social-Democrats were to support all national demands of the bourgeoisie of oppressed nations. To a hired worker it is all the same whether his predominant exploiter will be the Great Russian bourgeoisie preferably over a non-Russian one, or the Polish preferably over a Jewish one, etc. **A hired worker who has realized the interests of his class is indifferent both to the state privileges of the Great Russian capitalists and to the promises of the Polish or Ukrainian capitalists that paradise on earth will be established when they possess state privileges**.

...In any case, the hired worker will remain an object of exploitation, and a successful struggle against it requires the independence of the proletariat from nationalism, the complete, so to speak, neutrality of the proletarians in the struggle of the bourgeoisie of different nations for supremacy. The slightest support by the proletariat of any nation for the privileges of "its" national bourgeoisie will inevitably cause distrust of the proletariat of another nation, will weaken the international class solidarity of workers, will divide them to the delight of the bourgeoisie. And the denial of the right to self-determination, or to secession, inevitably means in practice support for the privileges of the dominant nation" [8, pp. 594-595].

"In the question of the self-determination of nations, as in any other question, we are interested first of all in the self-determination of the proletariat within nations" [8, p. 597].

[Nowadays, such an approach remains topical, counting on the unification of all wage workers (regardless of nations and nationality) in the struggle and opposition to the associated oligarchy.

In the application to the present day, everywhere in the text of Lenin's work, by the proletariat one should understand the wage workers and representatives of wage labor, and by the bourgeoisie of the oppressing and oppressed nation — the foreign and local oligarchy. After making such a replacement, everything falls into place; as can be seen, the relations of wage workers and the oligarchy, as well as the consequences of these relations, are written by the author of the book with the utmost clarity long before the October Revolution. **We are obviously being punished today for *Unlearned lessons of dialectics*, as negligent students, although we have already passed all this once**.

To please their personal interests (i.e., in pursuit of profit), the bourgeoisie (oligarchy) of any nation easily steps over national and patriotic principles,

which fully justifies the label "comprador" (venal) bourgeoisie hung on it. This, first of all, must be known and kept in mind by every people trying to find the roots of national troubles. Only a consciously **organized** opposition to the market (i.e., spontaneously) "molded" oligarchy can change the position (and status) of the working people for the better. Today's bourgeoisie, like the bourgeoisie of the past, are also not interested in social development (i.e., in improving methods of management and planning, economic and political reforms, raising the standard of living of the population), since all this contributes to the growth of consciousness, education and, accordingly, **organization** of wage workers. Therefore, no one is in a hurry, and will not be, to transfer or invest their foreign savings and capital (allegedly earned "by their own sweat and blood") into the country's economy, to abandon offshore assets.

What allows us to confidently use in this connection the terms "oligarchs", "oligarchy"? It is enough to look more closely at the structure of property, income and acquisitions of any major official or deputy (not losing sight of relatives and trusted persons with assets rewritten to them) to see there both the owners of the means of production, and shareholders of the most profitable industrial enterprises and banks, and owners of large property, owners of bank accounts and financial assets, and, moreover, undoubtedly, **those residing in power**. And then how do such managers differ from oligarchs or, at worst, from "near-oligarchs"? By formal features and definition — not at all, and among themselves they differ only in the size of appropriations and the degree of influence on the political and economic decisions made regarding the fate of the country or region; in the final analysis, all the so-called oligarchs differ from each other only in the size of the damage inflicted on the country. In general, all capitalist states are built on an oligarchic type (scheme): first money is made (and capital is accumulated), then power is desired in the name of new opportunities and new money, and the combination of both again multiplies power and money. For a person with an unprepared, immature, undeveloped consciousness — this is a dead end, a closed vicious circle, a trap. A corrupt capitalist country is always an oligarchic state. On the other hand, the management configuration that has developed in the country today is quite accurately determined by the term "plutocracy". On the third hand, this is, of course, also an "autocracy", represented by the "face" of the current "ruler". Before us is such a volatile mixture of plutocratic, oligarchic and autocratic elements of statehood. In this infrastructure, where there is everything and a lot of it, there is only one small link missing — **the rule of the people; the working people simply do not "fit" with the modern government and therefore are not represented in the government**].

There are assurances that "the recognition of the right to secession increases the danger of the state's disintegration. ... From the point of view of democracy in general, it is quite the opposite: the recognition of the right to secession reduces the danger of the "disintegration of the state"" [8, p. 592].

Further, the question is examined using the example of the Ukrainian nationality: "Is it not clear that the more freedom the Ukrainian nationality has in one or another country, the stronger the connection of this nationality with the given country will be? It seems that one cannot argue against this *ABC* truth if one does not decisively break with all the premises of democratism. And can there be greater freedom of a nationality as such than the freedom of secession, the freedom of forming an independent national state?" [8, p. 592].

[At first glance, it may seem incorrect that the dialectical position, according to which the recognition of the right of nations to self-determination does not increase the danger of the state's disintegration, but on the contrary, cements the country and strengthens the ties between nationalities — since in relation to, say, the above-mentioned Ukrainian nationality, this dialectical position was not fulfilled and is not being fulfilled. However, in this particular case, the following circumstances should be taken into account. Unlike the conditions and events corresponding to the temporary stage analyzed in the book by Lenin we are considering, for some time now (already in our times), under the patronage of the local "comprador" oligarchy, on the territory once called the Ukrainian SSR, a shoot of rabid nationalism and fierce hatred of everything Russian, cultivated in the deep past and pulled out from the dilapidated sewer outlets, has bloomed in full bloom. From this perspective, the revived phenomenon already falls under the definition not of a traditional national liberation movement (acquiring freedom and the right of a nation to self-determination), but of aggressive Nazism based on blood feud and innate hatred (the roots of which must be sought in the origin of the once artificially bred and carefully selected "marginal" nationalism), the formation of which has little in common with a national liberation movement. Extremely interesting in this regard is the fact that from a whole range of levels-forms within the composition of their multi-level totality (uniting in itself diverse methods of interethnic interaction), the lowest, most primitive level receives an impetus for priority development (under the "management" of the same universal principle of *Self-development*) in the image of some fanged horned creature with a tail and fur that has not yet fallen off, crawled out of a dark deep cave to teach the whole civilized world its understanding of life and interethnic communication. Like a weed stifling cultivated plants at the root, this primitive "misunderstanding" is capable for some time of diverting to itself and "grinding" the contentful volumes worked out later, but already tested, or, simply put, absorbing (destroying) the civilized forms of higher levels. Such are the curiosities and "inscrutable" paths of the dialectical development of diverse forms-levels of reality].

As for the attitude to the national question, for example, of Marx: "Marx makes no absolute of national movements, knowing that the complete liberation of all nationalities can only be given by the victory of the working class. To take into account in advance **all possible correlations** between the bourgeois liberation movements of oppressed nations and the proletarian liberation movement among the oppressing nation (this is precisely the problem that makes the national question so difficult in modern Russia) is an impossible thing" [8, p. 608].

[In other words, one must support the oppressed nation in its struggle and direct this struggle towards facilitating the proletarian movement, since the analysis of all variants of correlations (line-up of forces) between the forces of national liberation and proletarian movements (in their relation) is impossible even with the involvement of the intellectual power of 70 Marxs (to use Lenin's words, who always meant the constant presence of some objective uncertainty in the development of certain forms-relations and the impossibility of knowing or anticipating the development of these forms with one hundred percent certainty). As we can see, the ability to think dialectically allowed the classics of Marxism, and in particular V.I. Lenin, to focus attention by no means on obtaining exhaustive knowledge about the outcome of the interaction of the studied components, but only on understanding the tendency of variability of their relations, in order to already on this basis forecast the further development of their forms].

"The protocols of the congress of 1903 [II Congress of the RSDLP], which adopted the program [of the party] of Russian Marxists, have become the greatest rarity, and the vast majority of modern figures of the workers' movement are not familiar with the motives of individual points of the program.

...Let us note first of all that, however scanty the Russian Social-Democratic literature concerning the "right of nations to self-determination" may be, it is nevertheless absolutely clear from it that this right was always understood in the sense of the right to secession.

...The reader sees that at the II Congress of the party, which adopted the program, there were not two opinions on the question that self-determination means "only" the right to secession" [8, pp. 610-611, 613].

"...**The right to secession presupposes the solution of the question precisely not by the central parliament, but only by the parliament (sejm, referendum, etc.) of the seceding region**" [8, p. 617].

"Great Russian nationalism, like any nationalism, goes through various phases [i.e., this question, like any other, Lenin considers through the prism of historical development: from having a hard autocratic reactionary color to appearing in the color of bourgeois liberalism], depending on the predominance [i.e., on the bias and shift towards a more substantial, more contentful component in their relation — in this case in the relation {bourgeois national-liberalism/autocratic monarchic national-reactionism}] of one or another class in a bourgeois country. Before 1905, we knew almost only national-reactionaries. After the revolution of 1905, national-liberals were born among us. And further, the birth of Great Russian national-democrats is inevitable" [8, p. 619].

"From the point of view of the theory of Marxism in general, the question of the right to self-determination presents no difficulties. There can seriously be no talk

either of challenging the London decision of 1896, or of the fact that by self-determination is meant only the right to secession, or of the fact that the formation of independent national states is a tendency of all bourgeois-democratic upheavals.

The difficulty is created to a certain extent by the fact that in Russia the proletariat of oppressed nations and the proletariat of the oppressing nation are fighting and must fight side by side. To defend the unity of the class struggle of the proletariat for socialism, to repel all bourgeois and Black-Hundred influences of nationalism — this is the task. Among the oppressed nations, the separation of the proletariat into an independent party sometimes leads to such a fierce struggle with the nationalism of a given nation that the perspective is distorted and the nationalism of the oppressing nation is forgotten" [8, pp. 617-618].

"The slower the democratic transformation of Russia goes, the more persistent, rough, and fierce will be the national persecution and squabbling of the bourgeoisie of different nations. ...Full equality of nations; the right of nations to self-determination; the merging of workers of all nations — this national program teaches workers Marxism, teaches the experience of the whole world and the experience of Russia" [8, p. 620].

[Analyzing the above, one can be convinced that the slogan in defense of the right of nations to self-determination is always relevant — since it is an indicator of the recognition of the equality of all small and large nations in a multinational state (which, undoubtedly, should serve as the main condition for the cohesion of nations in union states); in case of legalizing this right, it is easier for the oppressed classes to defeat any oppressor, uniting on the basis of equality of all nations.

True equality of nations is conditioned and ensured only by the recognition of the right of nations to self-determination (political self-determination, i.e. possible and permissible secession). This principle of self-determination is relevant for Russia (as it was relevant for the USSR) also because its peoples, like the peoples of the USSR, united and entered unions, as a rule, with their territories — i.e., not being newcomers or immigrants, which cannot be said, for example, about the USA and a number of other states.

But all this was accepted with delight and looked exactly like that until the right of nations to self-determination enshrined in the constitution suddenly served as a reason for merciless accusations of destroying a great country. It goes without saying that the main claims were made against the founder of the first socialist state in the world, Vladimir Ilyich Lenin, who allegedly "laid" a delayed-action "mine" under the Soviet Union.

Advancing such accusations, no one even remotely thinks about the objective possibility of an unfavorable (from the point of view of human plans and

hopes) course and outcome of *content-form transformations*, which always take place in the process of reality development. No one thinks about the inevitability of content-form transformations, conversions, transfigurations to which any developing form is subjected in the process of "making itself out of itself". In this case, it was only required to be a very well-informed and competent leader to always remember the objectivity of the tendency of natural transfiguration of forms into their opposite, i.e. about the immanent dialectical property (character) of developing reality, described by the formulation of the universal principle of *self-development* (see above).

Nevertheless, the real state of affairs is such that by virtue of this very dialectical nature of the surrounding world, everything (without exception) sooner or later has a habit of returning "to its own circle", but not in its former form, but in other — "modified" — forms. In case of misunderstanding such a layout or in case of inept and imprudent handling of the mentioned modified forms — the impacts, and even blows of these weighted returning forms may fall not where the lower back is (it would be fine if it were so, which is still tolerable), but where the neck is higher.

Having detected such a trend manifesting in connection with the development of one or another form of reality, one can and should learn (if necessary) to influence this trend, preventing or anticipating the emergence of undesirable (from the point of view of human consciousness) consequences, which, naturally, no one in those times fulfilled not only was not, but was not even supposed to be fulfilled — after all, the last outstanding dialectician in the chain of responsible persons turned out to be Lenin, and all his other followers and continuators, from the point of view of dialectical training, are neither here nor there (*ne prishey kobyle khvost*). However, to blame, in all troubles and failures, the one who understands such issues best — this is in our days (as, indeed, always) a downright sign of good manners. Having an idea of the inevitable transformation or transfiguration of changing forms into their opposites (i.e., about returning "to one's own circle"), in order to keep these forms within the framework of their former status, it is necessary in various ways to increase their *contentfulness* (in this case — literacy, education, awareness, etc.). Perhaps, one cannot even think of a more vivid example in confirmation of **the urgent need to master the art of dialectical thinking, dialectical research approach and practical activity!**

In the USSR, at the stage of swaying and the so-called "perestroika", the party nomenclature (the forerunner of the emerging bourgeoisie) of precisely "aliens", i.e. national formations (republics), finally went out of the control of the central authority, which determined the collapse of the great Union. Starting from the Khrushchev times, and especially during the Gorbachev perestroika time, obvious and covert decomposition, de-ideologization and transfiguration of both central (union) and local (republican), in modern slang, "elites" (or rather, pseudo-elites — party nomenclature, top and middle managers, heads of large enterprises, etc.) was in full swing, which

were swiftly becoming "philistinized" and "bourgeoisified", turning into their own ideologically *contentless* (but filled with bourgeois-mercantilist content) opposite in full accordance with the dialectical character of reality development. As is proper in such "non-transparent" cases (i.e., in times of turmoil), the contentful cause of what is happening is pushed to the background and its place is "draped" with the Formal component of the real process. In the established relation {nomenclature power in the localities / formal arrangement of local power based on the right of nations to political secession}, due to the sharp spontaneous-uncontrolled expansion of the powers and capabilities of the nomenclature local power (i.e., the "swelling" of the contentful component or the "numerator" of the above-mentioned relation), the "denominator" of the relation also begins to change — towards isolation or separation from the center and the dominance of the nomenclature local pseudo-elite (power structures).

The correctness and validity of the idea of the right of nations to self-determination even at that moment is beyond any doubt provided that strict control is ensured over other particulars and details. The motives and actions of the nomenclature of "aliens" (using the terminology of Lenin's articles), which, having found itself without "supervision and care", played its mercantilist card to the victorious end, which could have been decisively suppressed on quite legal grounds, should have been put under control.

Illegal actions of the decaying nomenclature at the level of republican authorities should have been stopped, relying on the "Constitution (Basic Law) of the USSR" and on the then still functional central and republican structures of law enforcement agencies: KGB, MVD, MO (Chekists, police, army), continuing to keep ideology and personnel policy under control. And, as we now know for sure, due to the lack of such control and countermeasures, the internal decomposition of the pseudo-elite ends, in the end, with its transformation into an oligarchy of central and local significance (scale); and, of course, not without external foreign influence and complicity. Unprincipled and unscrupulous nouveau riche nomenclature figures in conjunction with inveterate bandits and criminals became the new masters of life.

Yes, the decisions (and actions) of the local pseudo-elites formally fell under the patronage of the constitutional right of nations to self-determination, but these decisions were not legal from the point of view of confirmation by the officially identified will of the majority of citizens of the national republics. The legality of actions was replaced by "under-the-table" activity and the pushiness of local nomenclature structures and individuals. Thus, not the notorious right of nations to self-determination became the cause of the destruction of the USSR, but the dominance that had developed by that time of the satiated, transfigured de-ideologized "comprador" (venal) top and the lack of control over its behavior.

Thus (it is emphasized specifically for the current "rulers" and their ilk), Ilyich did not "lay" any "mines" in the arrangement of the multinational Soviet state — all decisions of the Bolsheviks were conditioned by the specific context of the epoch experienced and there is nothing to blame him for the alleged lack of foresight; in our opinion, the current "armchair" opponents and experts should read his works more attentively and thoughtfully and not rush to proclaim their own mental superiority. The very raising of the question of the alleged "laid mine" testifies to an insufficiently high level of intelligence and education of the persons raising this issue, since the question regarding the "exhaustion" or discovered over time "non-operability" of this decision should not be asked of Lenin, who, we repeat, knew how to skillfully draw conclusions and make decisions in accordance with the circumstances of a certain time stage, but with those persons who, due to the rigidity of their thinking, could not subsequently flexibly react to changing conditions. The role and significance of the human factor (and personnel policy), ladies and gentlemen, no one has yet canceled. Again, without possessing a dialectical mindset, it is oh so difficult to search for and find correct solutions to the most complex questions — which pushes (forces) ordinary incompetent persons (including superficial researchers) to shamelessly attribute all mistakes and miscalculations to ***extraordinary***, but, unfortunately, humble and silent predecessors.

It is quite probable that in our days a variant of establishing a union association could be more productive, in which any national formation (republic, state, autonomy) would enter the composition of a new federal arrangement on the rights of a territorial district with the same "right to self-determination", but not on a national, but on a territorial basis and with the obligation to establish a single citizenship for the entire population as an indicator of belonging to the common state structure (well, naturally, and with all other attributes of a single state: a single currency, common goals, a single defense doctrine and law enforcement agencies, etc.). But this is still a question requiring the involvement of dialectical minds for its effective solution, who would be able to track the peripeteia of the changing situation and accordingly adjust the decisions made throughout the entire period of the relevance of this issue. God forbid the current "rulers" should imagine themselves to be qualified "resolvers" of national problems, and on this wave get involved in defusing the "mines" allegedly "laid" by Lenin. Without taking into account the numerous nuances of the national question, these "resolvers", not being skilled dialecticians for a single time, will make a mess and out of ignorance or lack of foresight will finally bury a big country under this firewood.

In any case, a simple solution to the national question by means of the so-called "melting pot", from which serious racial problems, still not even close to being resolved, suddenly crawled out (as the American near-election crisis of 2020 shows), is also impossible, which should be taken into account by all primitive figures and flat "resolvers" when they assume to close the sore topic once and for all in this way.

Meanwhile, this issue remains extremely topical at least because the sovereignty (and, consequently, the identity) of a small nation (for example, the people of Belarus in modern conditions) can be ensured and preserved on the principles of the right of a nation to self-determination only if it exists (functions) in symbiosis with a large (predominant in population) nation (within or under the wing of a united Russia or an updated, modernized USSR, for example), which guarantees this sovereignty and undertakes to protect the small nation from attacks and claims from aggressive capitalist neighbors; otherwise, as the practice of today shows, the aspiration (as a temptation) of a small (unself-sufficient) state to pursue its own **independent** policy (adherence to the so-called political multi-vector approach) will sooner or later turn this state into an appendage of more powerful capitalist states with inevitable leveling (nullification) of its national identity. In fact, the analysis of Lenin's vision of the development options of this topic leads precisely to such a conclusion.]

2. The manifesto "**War and Russian Social-Democracy**" [8, pp. 622-628], published in November 1914, was the first official document of the RSDLP, which outlined the position of the Bolshevik party regarding the beginning of the world imperialist war.

"The European war, which for decades had been prepared by the governments and bourgeois parties of all countries, broke out. ... Seizure of lands and subjugation of foreign nations, ruin of a competing nation, plunder of its wealth, diversion of the attention of the working masses from the internal political crises of Russia, Germany, England and other countries, disunity and nationalist duping of workers and the extermination of their vanguard for the purpose of weakening the revolutionary movement of the proletariat — such is the only real content, significance and meaning of the modern war" [8, p. 622].
[At the beginning of the article, Lenin analyzes the current situation and the alignment of forces, showing that at the head of one of the warring groups stands the German bourgeoisie, assuring the working class that it is waging a war for the defense of the homeland, freedom and culture, for the liberation of the peoples oppressed by tsarism and the destruction of reactionary tsarism, but in fact being a faithful ally of tsarism and the enemy of the revolutionary movement of workers and peasants in Russia and supporting the tsarist monarchy against the revolution in Russia. At the head of the other group of warring nations stands the English and French bourgeoisie, duping the working class and the working masses, claiming that it is waging a war for the homeland, freedom and culture against militarism and despotism of Germany, but in fact striving to seize German colonies and ruin a competing nation, distinguished by faster economic development. Contentful enrichment (accumulation of the content of one's own form) at the expense of others, at the expense of competitors — this is the meaning of this war (division, redistribution and seizure of markets, destruction of competitors). In other words, the attitudes of lower (i.e., more primitive) levels-forms towards multiplying their contentfulness by taking away and consuming "alien" content overcome or take precedence over the socialist attitudes or goals of more developed levels, professing the accumulation and increase of their contentfulness through joint creative labor,

conducting research of developing reality by common forces, cognition and forecasting by joint efforts of the emergence of new forms of reality at all levels, as well as directions of prospective human activity].

"Both groups of belligerent countries do not yield to each other in robberies, atrocities and endless cruelties of war, but in order to dupe the proletariat and divert its attention from the only truly liberating war, namely the civil war against the bourgeoisie of both "their" country and "foreign" countries, for this high purpose the bourgeoisie of each country with false phrases about patriotism tries to exalt the significance of "its" national war and assure that it seeks to defeat the enemy not for robbery and land seizure, but for the "liberation" of all other peoples, except its own.

...But the more diligently the governments and the bourgeoisie of all countries try to disunite the workers and set them against each other... — the more urgent is the duty of the conscious proletariat to defend its class cohesion, its internationalism, its socialist convictions against the rampage of chauvinism of the "patriotic" bourgeois clique of all countries. To refuse this task would mean on the part of the conscious workers to refuse all their liberating and democratic, not to mention socialist, aspirations.

With the deepest bitterness, it has to be stated that the socialist parties of the main European countries did not fulfill this task of theirs, and the behavior of the leaders of these parties — especially the German one — borders on direct betrayal of the cause of socialism. At the moment of the greatest world-historical importance, the majority of the leaders of the current, second (1889–1914) Socialist International are trying to replace socialism with nationalism. Due to their behavior, the workers' parties of these countries did not oppose themselves to the criminal behavior of the governments, but called the working class to merge their position with the position of the imperialist governments. The leaders of the International committed treason in relation to socialism, voting for war credits, repeating the chauvinistic ("patriotic") slogans of the bourgeoisie of "their" countries, justifying and defending the war, entering the bourgeois ministries of the warring countries, etc., etc. The most influential socialist leaders and the most influential organs of the socialist press of modern Europe stand on a chauvinistic-bourgeois and liberal [by the way, nothing has fundamentally changed since then], by no means on a socialist point of view. The responsibility for this disgrace of socialism falls primarily on the German Social-Democrats, who were the strongest and most influential party of the Second International" [8, pp. 623-624].

"The collapse of the Second International is the collapse of opportunism [apostasy and conciliation], which was cultivated on the soil of the features of the past (the so-called "peaceful") historical epoch and gained actual domination in the International in recent years. The opportunists had long been preparing this collapse, denying the socialist revolution and replacing it with bourgeois reformism; denying the class struggle with its necessary transformation at certain moments into a civil war and preaching class cooperation...

...It is impossible to fulfill the tasks of socialism at the present time, it is impossible to realize the real international cohesion of workers without a decisive break with opportunism and explaining to the masses the inevitability of its fiasco.

[In other words, the war and the inability of the European social-democrats to resist the bourgeoisie, their conciliation with the slogans of the bourgeoisie testify to the collapse of the Second International, which Lenin proposes not to hush up, but on the contrary, to recognize and emphasize. Without demarcation from such a position of the bourgeoisie, it is impossible to fulfill the tasks of socialism — it is absolutely impossible to realize the international cohesion of workers without a break with the apostates and conciliators].

The task of the social-democrats of each country must be in the first place the struggle against the chauvinism of the given country.

...In the current position, it is impossible to determine, from the point of view of the international proletariat, the defeat of which of the two groups of belligerent nations would be the least evil for socialism. But for us, Russian social-democrats, there can be no doubt that from the point of view of the working class and the working masses of all the peoples of Russia, the least evil would be the defeat of the tsarist monarchy, the most reactionary and barbaric government, oppressing the greatest number of nations and the greatest mass of the population of Europe and Asia.

The immediate political slogan of the social-democrats of Europe should be the formation of a republican United States of Europe, and in contrast to the bourgeoisie... the social-democrats will explain all the falsity and senselessness of this slogan without the revolutionary overthrow of the German, Austrian and Russian monarchies.

In Russia, the tasks of the social-democrats, due to the greatest backwardness of this country, which has not yet completed its bourgeois revolution, should still be the three main conditions of a consistent democratic transformation: a democratic republic (with full equality and self-determination of all nations), confiscation of landlords' lands and an 8-hour working day. But in all advanced countries, the war puts the slogan of socialist revolution on the agenda. ...The use by the bourgeoisie of the laws of wartime for completely silencing the proletariat sets before it the unconditional task of creating illegal forms of agitation and organization. ...The Proletarian International has not perished and will not perish. The working masses will create a new International through all obstacles. The current triumph of opportunism is not long-lasting. The more victims of the war there are, the clearer it will be for the working masses of the betrayal of the workers' cause by the opportunists and the necessity to turn weapons against the governments and the bourgeoisie of each country" [8, pp. 626-627].

Summing up all the "pros" and "cons" in the current international situation, i.e., analyzing the probable direction of change in the ratio of the active (*contentful*) and passive (*formal*) components in the relation composed of them, and in this regard basing on the necessity of replacing the relation {people (instigated by the bourgeoisie) of one country / people (instigated by the bourgeoisie) of another country} with a more *contentful* and therefore more correct relation {proletariat of the belligerent countries / bourgeoisie of the belligerent countries}, composed of objectively internally conflicting components, Lenin comes to the conclusion that: "The transformation of the modern imperialist war into a civil war is the only correct proletarian slogan, indicated by the experience of the Commune... and following from all the conditions of the imperialist war between highly developed bourgeois countries. However great the difficulties of such a transformation may seem at one or another moment, socialists will never abandon systematic, persistent, steady preparatory work in this direction, once the war has become a fact. Only on this path will the proletariat be able to break out of its dependence on the chauvinist bourgeoisie and in one form or another more or less quickly take decisive steps along the path to the real freedom of peoples and along the path to socialism" [8, p. 628].

3. The small article "**On the National Pride of the Great Russians**" [8, pp. 629-632] with a serious subtext of ambiguous views was written in December 1914.

From the content of the article, first of all, it must be understood that the conscious unification of small peoples and nationalities is possible only on the basis of the legalized right of nations to self-determination or a guaranteed opportunity for their free secession. And this content echoes the ideological content of the work "On the Right of Nations to Self-Determination".

Lenin begins his analysis by describing the state of affairs that had developed at that moment, when many correct words "are said, interpreted, shouted... about nationality, about the fatherland... the greatness of the principle of national independence". Meanwhile, he continues, "... before us is a very wide and very deep ideological current, the roots of which are very firmly connected with the interests of the ruling landlords and capitalists of the great-power nations. **Tens and hundreds of millions are spent annually on the propaganda of ideas beneficial to these classes**..." [8, p. 629].
And it would be improper for us, Lenin writes, as representatives of a great-power nation, to forget about the enormous significance of the national question, especially at a moment when the tsarist monarchy has put millions of Great Russians and non-Russians under arms to "solve" a whole range of national questions exclusively in accordance with its own interests (the interests of the united nobility, serf-landlords, capitalists), while the same tsarist executioners (noblemen and capitalists) subject our beautiful homeland to oppression, violence, and mockery. Today, in Lenin's words, we are full of a sense of national pride, for the Great Russian nation, overcoming

its slave past, has also created a revolutionary class, has also proven that it is capable of giving humanity great examples of the struggle for freedom and for socialism, and not only great pogroms, rows of gallows, dungeons and great servility before priests, tsars, landlords and capitalists. And we are proud because after 1905 the Great Russian muzhik began to become a democrat and began to overthrow the priest and the landlord. It is precisely because we want a free and independent, sovereign, democratic, republican, proud Great Russia at all costs, building its relations with neighbors on the human principle of equality, and not on the humiliating great nation feudal principle of privileges, that we say: one cannot defend the fatherland otherwise than by fighting with all revolutionary means against the monarchy, landlords and capitalists of one's fatherland, i.e. the worst enemies of our homeland; Great Russians cannot defend the fatherland otherwise than by wishing defeat in any war to tsarism (as the least evil for the overwhelming majority of the population of Great Russia), for tsarism not only oppresses this majority of the population economically and politically, but also demoralizes, humiliates, devalues, prostitutes it, accustoming it to oppressing foreign peoples, accustoming it to cover up its shame with hypocritical, **allegedly patriotic** phrases. In this connection, from the point of view of the interests of precisely the Great Russian proletariat, it is necessary to conduct a long-term education of the population in the sense of the most resolute, consistent, bold, revolutionary defense of full equality and the right to self-determination of all nations oppressed by the Great Russians. "The interest (not understood in a slavish way) of the national pride of the Great Russians coincides with the socialist interest of the Great Russian (and all other) proletarians" [8, p. 632].

[As already noted earlier, instead of the terms "tsarism", "bourgeoisie", "capitalists", etc., one can safely use terms close in their current meaning: "autocracy", "oligarchy", "plutocracy", "ruling pseudo-elite", "comprador liberal top", etc.

This article by V.I. Lenin is such a dynamic creation as all the others: from the initial, less contentful, through change — to a prospective, more contentful result and product. Like any other work by Lenin, this article can be structurally and compositionally laid out in the following template. Initial point (thesis): the position or view of the ruling class (autocracy, tsarism, the emerging and strengthening Great Russian capitalism) on the essence of Russian patriotism; i.e., by stating the skin-deep interests of this class, supported by the propaganda of hypocritical kvass patriotism, one component of the relation is established. Next point in development (antithesis): the essence and definition of Russian patriotism from the point of view of the revolutionary proletariat and its interests. In this way, the other component of the relation is determined. Then, from the found components, a more contentful component is identified (by detecting and verifying the falsity, insincerity and untruth of one component, and vice versa — the authenticity, truthfulness and greater objectivity of the other) and on this basis the correct relation of the found components (synthesis) is

built, possessing the property and ability of *self-development*, — with simultaneous forecasting of the development prospect of the whole relation as a whole. As a result of comparing two opposite positions and views on Russian patriotism belonging to two different interacting components (classes) in the relation {proletariat/tsarism (autocracy)}, the Bolsheviks give preference to the position of the proletariat and, developing, increasing the contentfulness of this position (by explanations, agitation and propaganda), achieve its predominance in the integral unified relation, which, in the end, in the future and leads to the curtailment of hostilities and the end of the bloody imperialist war.

Knowing in advance that in any conflict, in any interaction there are always at least two sides, two components (namely: the *contentful* and *Formal* components of development) of one relation, by the nature and intensity of whose interaction the rate and completeness of the increase in the *contentfulness* of the entire relation are determined, — it is very important to correctly identify and determine these interacting sides-components in order to compose a relation from them; a correctly composed relation of two directly interacting sides (two most essential components) gives the most energetic, effective and optimal increase in *contentfulness* and development of both the components separately and the relation as a whole.

Let us give more examples of correctly composed relations. In the relation {wage labor/capital}, the components are inseparable, insignificant without each other, and therefore this relation is not contrived, not sucked out of the finger, but natural and natural. The same applies to such (derivative of this relation and accompanying this relation) relations as {proletariat/bourgeoisie}, {Soviets/Provisional Bourgeois Government}, etc. Correctly composed relations are easily amenable to research and analysis (for example, for the purpose of forecasting the prospects of their change and development)].

[However, the pre-war situation developing in our time seems somewhat different than on the eve of the First World War: it is beneficial for both international and national (to preserve their status quo) capital that Russia should give up its positions, while today's have-nots (wage workers) are inherent in patriotism — as something that is present in them from birth, and not bought or appropriated. Therefore, the slogan or call "for the Motherland!" is sincere and modern as never before precisely for the common people (in the hope of the coming socialist social transformations). The "comprador" top thinks quite differently, there is no trace of patriotism there — on the contrary, the latter is oppressed and despised by all forces and means.

The litmus test of Russian patriotism today is the attitude towards Crimea and Donbass. The entire "patriotism" of oligarchs and plutocrats consists in justifying the circumstance that financial-industrial (oligarchic and state-

monopolistic) structures do not "bring" either business or banks to Donbass and partially to Crimea (ignoring the problems of people living in the specified territories) allegedly so as not to harm the whole country. In fact, here one can see simple fears for their personal "hides", which may be spoiled by the notorious Western sanctions. Furthermore, the supply of all types of fuel (and other energy resources), spare parts and components to the armed forces of a hostile state killing people on the territory of Donbass — is also evidence of the same "patriotism" of the same structures. If one digs deep enough, one can find a lot of amazing, shameful and criminal things in the actions and behavior of today's "domestic" bourgeoisie.

The problem of Novorossiya can be resolved in the shortest possible time provided that the issue of neutralizing the ruling "comprador" top of the Russian plutocratic state is resolved. Even the "Washington regional committee" does not play such a significant role here. In fact, everything boils down to eradicating sabotage and overcoming resistance within the country (treason — that is what it was called in hoary antiquity).]
[The policy of the current "ruler" towards Donbass is an ostrich head in the sand, a policy of betrayal and apostasy towards the Russian people living there. Only a cowardly, well-fed, ruling, venal bourgeois top can endure and bear the dictate and mockery of the overseas "hegemon" (unremittingly supervising all decisions on Donbass). A timid "governor" who lacks the will and ability to cope with his "comprador" entourage — this is the reason for the lack of positive effect and the required outcome in solving the problem of Donbass (and Novorossiya as a whole). The key to solving this problem is in Moscow. But an indecisive and venal "ruler" is unlikely to cope with this task; a leader with stronger convictions and righteousness is needed. How many bloody conflicts could have been "nipped in the bud" if one did not follow the wake of the requests and goals of the financial-industrial oligarchate, to whom their own business projects and profits are much closer and more important than the interests of an entire country with its people.

People whom he reassured expect protection and help from the current "ruler", and he time and again cowardly tucks his tail in fear of losing his well-being and the favor (support) of his companions — god forbid the Western masters "cut off the oxygen" for him and his entourage as well. Feel the difference: an incorruptible, resolute and fearless revolutionary Lenin on the one hand, and venal, dependent in everything on the overseas "hegemon" (and therefore — timid and indecisive) current "rulers" on the other. On the eve of a quite probable "hot" war, Russia can only be saved by a "purge" of the ranks (according to Lenin) and the neutralization of the "fifth column" (according to Stalin). Unity, firmness and support of the people in this matter are unshakable.

The perfect weapon created thanks to the contentful resource of the people — this should be the main argument of the modern "governor" in response to the unprecedented onslaught and pressure from the "hegemon". Instead of

organizing a well-thought-out series of "jabs" (inflicting damage on the overseas "hegemon" in a volume sufficient to demoralize the public consciousness of the "democratizers") and thus showing who is the master in the house by demonstrating the advantages of their latest military equipment and military skill, our "rulers" are incessantly bowing and scraping and bowing. One wonders, who and why then need expensive military "toys", if there is no skill and understanding of how to use them for the benefit of the people? They are needed, first of all, to stop the dictatorship of the aggressor for years to come by inflicting on him a sufficiently disorganizing property and moral damage.

They are playing a dishonest game (a game without any rules) against us, and the "rulers", instead of worthily responding with the excellent means at their disposal, shamefully justify themselves and wipe themselves off every time after mocking spits from the completely impudent "hegemon".

The people have vested the current "ruler" with power and high powers so that he, on behalf of the people, would not allow the honor and dignity of the people to be trampled. If there is no strength to parry the attacks of the collective West — one should step aside and not cling to power, as Lenin did not cling to it, although he had much more reasons to be vested with this power. Moreover, one should step aside and take with him his diplomatic team of chronic whiners and moaners who do not know how to confront the insolent riff-raff and therefore constantly justify their worthlessness and inefficiency.

What the hell is all this military might needed for in the full disposal of the current "governor" (even if it is situationally transferred, for now), if he does not have the will to implement his own policy, does not know how to use this trump card for the benefit of the country and the people, if he stumbles and cowardly retreats at the first shout and askance look from the Western "master"? The timid and indecisive bungler should give way to a stronger, more resourceful, more purposeful, more courageous leader...

The understanding and justification of the admissibility and necessity of a Russian force response in this particular case is facilitated by referring to the well-known views of Clausewitz regarding the means of conducting state policy. It is enough to keep in mind that politics (as an instrument of pressure and imposition by various methods of worldview, position, point of view, way of life, etc., etc. of one group of people on another group of people) implies a **very extensive** set of means and techniques of influencing a partner, competitor, adversary or enemy, among which there may be methods of an encouraging, stimulating, preventive, economic, intimidating, forceful and any other nature. Every political player is free to choose at his discretion the most suitable means of influence from the entire arsenal of available means contrary to the detrimental opinion on the matter that one can and should play only by the rules established by individual players (or a player) claiming exclusivity and absolute dominance. In the times of

unprecedented trampling of all international rights and rules that have come, it is worth, perhaps, finally starting to play by one's own rules (?) or to reconcile and finally allow oneself to be buried alive? Moreover, any exclusivity is alien (foreign) to our international education in the spirit of "man is a friend, comrade and brother to man", and therefore claims to exclusivity and absolutism in this context should be curbed immediately. Contrary to and in opposition to the hypocritical foreign policy of not simple containment and economic pressure, but real **strangulation** and **destruction** of Russia — it has long been time for Russia to move on to retaliatory sobering "jabs" (i.e., to counteract by those means that it has in its arsenal and that are most **appropriate** and **effective** in the given circumstances).

"Well, what else should we expect? We keep begging. We get it on one cheek, and immediately offer the other. And so on to infinity. This will not end with anything good. In the end, if we survive, it is by accident. at the last moment and at a very high cost. As, indeed, we always do... " [14].
Enough to express toothless and spineless diplomatic concern about the insolent antics of the Anglo-Saxon conglomerate and its minions. It is necessary to wean them from **arbitrarily hindering** the development of anyone by methods of economic, political and any other blockade (i.e., through the so-called sanctions). We are talking about the **sacred right** of every people, every nation to **free economic and political development** (in this regard, it is appropriate to recall the classical Marxist position, known for its dialectics and indisputable justice, according to which only the free development of each is the condition for the free development of all). Not everyone understands today, unfortunately, that this right still has to be fought for, fought — and fought with all available means. And the fulfillment of this noble mission on an international scale can quite well be taken upon by Russia (possibly with its allies). Our people will understand the necessity and expediency of such preemptive steps and will support them most resolutely. If you do not want to walk as an "outcast" and eventually end up in some kind of "reservation" — you will have **to destroy** the established "sanction" system once and for all, using the force you have or at least creating a threat of inevitable use of force. And to restore the lost status quo, one must be ready to **forcibly** bring the "democratizer" out of the state of material and moral comfort that seems to him eternal and cloudless. This must be taken seriously. No one else will do this hard work for us. But. it seems that the current fattening government is quite satisfied with the established order of things.

And again we ask ourselves the same rhetorical question: what are all these expensive military means needed for, if not for ensuring the political and economic freedom, independence and sovereignty of the people, who created these security means for exactly this same purpose?

After proclaiming such a doctrine and simultaneously carrying out several series of demonstrative preventive "jabs", for many years these genderless

state formations (resembling today the fancied-up strutting "misunderstandings") will not dare to look askance at Russia or raise their voice; at least until they come to their senses and in an urgent reverse order "re-shoe" themselves into the traditional, due to dialectical nature, two-sex (bipolar) execution. And that rooster cry with which they will be hoarse at the moment of receiving a deserved thrashing will once again demonstrate to other peoples the fallacy and inconsistency of all these "democratic mentors", as well as the sham character of any rashly proclaimed hegemony and exclusivity.
Paradoxical as it may sound, this is precisely the most effective way to prevent a global war today.]

4. The article "**On the Slogan of the United States of Europe**" [8, pp. 633-636] was written in August 1915. It deals with the incorrectness (untimeliness) of this slogan in the economic aspect. If in the political aspect this slogan, put in connection with the revolutionary overthrow of the three most reactionary monarchies of Europe (German, Austrian and Russian), is completely invulnerable, there remains the most important question about the economic content and significance of this slogan. "From the point of view of the economic conditions of imperialism, i.e. the export of capital and the division of the world by "advanced" and "civilized" colonial powers, the United States of Europe under capitalism is either impossible or reactionary", since "**it amounts to an agreement on the division of colonies**" [8, pp. 634-635].

Capital has become international and monopolistic; the world is divided among a handful of "great powers" succeeding in great robbery and oppression of nations. In the era of the highest development of capitalism, a handful of great powers have organized the robbery of about a billion of the Earth's population. [Isn't this relevant today, and even to a greater extent? You read Lenin's article more than a century old, and it seems as if it is written about our time!]. A different organization (i.e. voluntary renunciation of colonies, spheres of influence, export of capital) is impossible under capitalism, as are a different basis and a different principle of division, except for force. Capitalism is private ownership of the means of production and the anarchy of production. To preach a "fair" division of income on such a basis is the dull-wittedness of a philistine. A billionaire cannot share income with anyone else otherwise than in proportion "according to capital". Hence — it cannot be divided otherwise than "by force" [i.e. by force methods]. And force changes with the course of economic development, and to check the actual force of a developing capitalist state, there is and can be no other means except war. Under capitalism [due to the anarchy and spontaneity of market production], uniform growth of economic development of individual farms and individual states is impossible, and therefore under capitalism there are no other means of restoring from time to time the disturbed equilibrium and eliminating disproportions than **crises in industry and wars in politics**. War is not in contradiction with the foundations of private property, but is a consequence of the direct and inevitable development of

these foundations (i.e. the need for periodic revision and redistribution of the accumulations of private property).

Thus, based on what has been said on the modern economic basis, i.e. under capitalism, the United States of Europe would mean the organization of reaction to delay the faster development of America. The times when the cause of democracy and the cause of socialism were connected only with Europe have passed irrevocably. Under such conditions, the slogan "United States of the World" would be more correct and relevant, however, it could give rise to an incorrect interpretation of the question in the impossibility of the victory of socialism in one country [8, p. 636].

The unevenness of economic and political development is an absolute law of capitalism. It follows from this that the victory of socialism is possible initially in a few or even in one single capitalist country. The political form of society in which the proletariat wins, overthrowing the bourgeoisie, will be a democratic republic, increasingly centralizing the forces of the proletariat of a given nation or given nations in the struggle against states that have not yet transitioned to socialism. On the basis of the foregoing, Lenin comes to the conclusion (makes a diagnosis) **about the impossibility of destroying classes without the dictatorship of the oppressed class** and the impossibility of the free unification of nations in socialism without a more or less long, persistent struggle of socialist republics with backward states. By virtue of these considerations, a conclusion is made about the incorrectness of the slogan of the United States of Europe at this particular historical moment [8, p. 636], since it will be expressed in the postponement of the beginning of the socialist revolution.

[Contentful essence of the socialist revolution, as noted in the article, is realized and presented not in the form of a one-time act, but in a whole series (epoch) of forms of political revolutions and counter-revolutions, violent political and economic upheavals, aggravated class struggle, civil wars, etc.

With regard to social transformations in Russia, the ultimately accomplished socialist revolution with an aim at building a classless society is just an initial stage or the first stage of the implementation of the socialist movement, which in the future will only expand, deepen and accelerate. At the same time, intermittency, stops, sharp turns, jerks, declines, rises (i.e. sections of visible regression and backward movement: crises, wars, coups, revolutions, counter-revolutions, etc.) are quite natural for this kind of movement and only confirm the spiral-cyclical nature of social development (as well as universal development as a whole).

It is the striving to achieve the highest contentfulness by the forms-carriers of social progress that will serve as the main factor causing periodic reference to the theoretical and practical developments generalizing the

results and experience of all previous stages of the mentioned revolutionary movement.

Here Lenin informs the reader that Switzerland, for example (and some similar "successful" and "prosperous" dwarf state formations), is the result of an agreement of international capital on the arrangement of completely neutral quiet "coves" and "harbors" for the reliable storage of funds, organization of recreation and tourism of the fat cats. It was also conceived by the mighty of this world as a place where the owners of large capital could catch their breath and rest from "righteous" labors next to their savings and accumulations. Thus, the defiantly colorful and openly transparent seemingly shell of some state structure turns out to be just a screen, shielding from the eyes of outsiders the inconspicuous true essence and purpose of such a structure, once erected by the efforts of a small handful of interested persons. Class solidarity, guarding the interests of the masters of life, will never allow the transition to transparency of relations of production, accumulation and consumption under capitalism. However, everything related to the contentful resource of one or another form and the sources of its accumulations will always be under lock and key and seals].

5. The article "**The Military Program of the Proletarian Revolution**" [8, pp. 751-761] was written in German in September 1916, and was printed only a year later. Then it was intended for Swiss, Swedish and Norwegian left Social-Democrats. The publication was preceded by the following foreword: "Nowadays, when Lenin is one of those figures of the Russian revolution who are most often spoken about, the following article of this old iron revolutionary, outlining a significant part of his political program, is of particular interest" [8, p. 834]. In the Russian language in Russia, this work was first published only in 1929.

Structurally and compositionally, the article is built according to the same very typical stencil: analysis of the current situation (state of affairs); identification of the interacting sides in their relation, both old and new (transformed and developed); determination of the active, leading, leading component in these relations, especially in the new one; forecasting the direction of variability of both the components-constituents themselves in this new relation and the relation as a whole.

The appearance of this article was caused by the circumstance that along with the justified and fair opposition to the false slogan of the social-chauvinists about the "defense of the fatherland" in the ongoing imperialist war, voices began to be heard in favor of replacing the old point of the Social-Democratic program "arming of the people" (formation of a "militia") with the new point "disarmament".

"The main argument is that the demand for disarmament is the most consistent expression of the struggle against all militarism and against any war." But in this argument lies the main fallacy of the supporters of disarmament: socialists,

without ceasing to be socialists, cannot be against any war, and in particular a revolutionary war, a national liberation war, a civil war (as well as the so-called "defensive" wars of the victorious proletariat against the bourgeoisie of other countries) [8, pp. 751-752]. And from a scientific point of view, it would be completely incorrect and unrevolutionary to bypass or obscure the most important and most difficult thing: the necessity of suppressing the resistance of the bourgeoisie during the transition to socialism. And in wars of this kind, to recognize "defense of the fatherland" means to consider these wars "just" and corresponding to the interests of the proletariat, since a reverse invasion of the bourgeoisie cannot be excluded in any war and, accordingly, resistance to such an invasion must be organized.

[Establishing a new relation with new components in this new relation in place of the relation {Entente (Great Britain, France, Russia) / Triple Alliance (Germany, Austria-Hungary, Italy)} (since new forces that entered into a new confrontation and war were awakened: {proletarian plus national revolution / bourgeois plus national-chauvinistic war}) requires finding a new correlation of these new components in the indicated relation, i.e. finding a new balance of the new forces that have entered the arena.

Thus, analyzing the predatory conflict through the prism of the previously incorrectly composed relation {people (instigated by the bourgeoisie) of one country / people (instigated by the bourgeoisie) of another country} and showing the hypocrisy and duplicity of the slogans of such falsely understood patriotism, Lenin moves on to a more correctly composed and substantiated relation from such components {proletariat of the conflicting countries / bourgeoisie of the conflicting countries} and already, proceeding from this new relation, one has to look for the correlation of its components, the direction of variability of this correlation and the direction of change (new forms) of the relation itself].

Theoretically, Lenin says, it would be completely erroneous to forget that any war is only a continuation of politics by other means: the current imperialist war is a continuation of the imperialist policy of two groups of great powers, and this policy is generated and fed by the totality of relations of the imperialist epoch. But the same epoch must necessarily generate and feed the policy of struggle against national oppression, and the struggle of the proletariat against the bourgeoisie, and therefore — the possibility and inevitability of revolutionary national uprisings and wars, on the one hand, and wars and uprisings of the proletariat against the bourgeoisie, on the other hand, as well as the unification of both types of revolutionary wars [8, p. 754]

To this, Lenin adds the following consideration: **one cannot forget that we live in a class society and there is and can be no other way out of it than through the class struggle**. In any class society (based on slavery, serfdom, wage labor), the oppressing class is armed (the military and the militia are taken into account — **otherwise, in the absence of means of suppression, social inequality or imbalance could not be maintained for an indefinitely long**

time). The arming of the bourgeoisie against the proletariat is one of the most basic facts of capitalist society. And to proclaim the slogan of disarmament for the proletariat against this background is tantamount to abandoning the point of view of the class struggle. On the contrary, the arming of the proletariat is the only possible tactic of the revolutionary class, a tactic dictated by the entire objective development of capitalist militarism, prescribed by this development. And therefore our slogan should be the arming of the proletariat [i.e. increasing the contentfulness of the form (the proletarian class) at a certain — force — sub-level of this form] in order to defeat and disarm the bourgeoisie. Saying that "capitalist society was and always is horror without end", Lenin masterfully notes the trend of piling up contentful accumulations conditioned by military actions, leading to "an end with horror" (a terrible end). And at the same time, contrary to established beliefs, behind this "terrible end" he sees the emergence and emergence of a new form and, accordingly, a new perspective, consisting in the fact that "before everyone's eyes, by the forces of the bourgeoisie itself, the only legitimate and revolutionary war is being prepared, namely: civil war against the imperialist bourgeoisie" [8, p. 755] with a new contentful turn in the course of the upcoming contentful transformations and transformations.

"Now militarization penetrates all public life" [8, p. 756]: today the imperialist bourgeoisie militarizes the entire male population, including youth, and in the plans for tomorrow — the militarization of women as well. Regarding this, one can say: so much the better, the sooner and closer to the armed uprising against capitalism. Mastering military science is necessary for the proletariat not in order to shoot at their brothers, workers of other countries, as is done in the current war, but in order to fight against the bourgeoisie of their own country, to put an end to exploitation, poverty and wars not by kind wishes and hopes, by statements of condemnation and concern, but by victory over the bourgeoisie and disarming it, which is achieved only by waging war against war, i.e. by civil confrontation and civil war.

The main disadvantage of the demand for disarmament lies precisely in the fact that all concrete questions of the revolution are left unattended (ignored). The "disarmament" of the proletariat (people), Lenin insists, professed by conciliators with the bourgeoisie of all stripes (opportunists, following Lenin's terminology), is precisely an escape from the vile reality, and not a struggle against it [the fundamental transformation of the established reality is possible only by decisive actions with weapons in hand]. The struggle against imperialism, not connected with the struggle against opportunism, is an empty phrase and a deception. The main danger emanating from all varieties of opportunism [i.e. conciliation and apostasy] is that they hush up (or talk out) the question of the connection of the ongoing war with the revolution and thus come out with a new absurd slogan: revolution without weapons [8, pp. 757-758].

Furthermore, the bourgeoisie of all great imperialist powers has become so reactionary [i.e. striving to avoid crisis and restore the lost balance in affairs] and so imbued with the striving for world domination [i.e. to achieve their contentful superiority] that any war on the part of the bourgeoisie of these

countries can only be reactionary. The proletariat should be not only against any such war, but should wish for the defeat of "its" government in such wars and use it for a revolutionary armed uprising, if an uprising with the aim of preventing the war fails [8, pp. 758-759].

With the conciliators (fighters for the disarmament of the people) one cannot fight by means of programs alone, but only by means of relentless observation to ensure that they are actually implemented. The largest fatal mistake of the bankrupt Second International was that the word did not correspond to the deed, that a habit of hypocrisy and shameless revolutionary phrase was cultivated. Disarmament as a social idea is generated, obviously, by the special "peaceful" living conditions of individual small states, which have stood aside from the bloody world road of wars for quite a long time and hope to remain so. The petty-bourgeois desire to stay away from the great battles of world history, to use their relatively monopolistic position for passivity — this is the objective social environment that can provide the idea of disarmament with a certain success and a certain spread in some small states. Of course, this aspiration is reactionary and rests on illusions, for imperialism one way or another drags small states into the whirlpool of the world economy and world politics. [This "wonderful" side or feature of the arrangement of "well-fed" lazy, arrogantly haughty communities and societies must always be taken into account: their impudently-pushy essence can be overcome by active persistent impact on them until the moment of their scattering to their shelters; brave and "pushy" at first, they are not able to withstand a long siege and continuous onslaught, leading to their physiological discomfort or threatening complete physical destruction].

Switzerland, for example, its imperialist situation prescribes two lines of the workers' movement: 1) the opportunists in alliance with the bourgeoisie strive to turn Switzerland into a republican-democratic monopolistic union to profit from the tourists of the imperialist bourgeoisie and so that this "peaceful" monopolistic position (a quiet "harbor") is as profitable as possible [here lie the roots of the success, prosperity and well-being of neutral dwarf states like Switzerland and the like. The quiet "backwaters" of Switzerland and similar small lands, where one can sit out and hide one's savings in days of great crises and upheavals, were prepared by the rich for themselves in advance — that is why these "areas" received such a lush bloom in inviolability]; 2) the real Social-Democrats of Switzerland seek to use the relative freedom and "international" position of Switzerland to help the close alliance of revolutionary elements of the workers' parties of Europe to win.

[Both lines are conditioned by the special position and the historically established status quo of a small country].
Proceeding from these two pronounced tendencies, it becomes clear, Lenin sums up, that objectively "disarmament" is a specifically national program of small states, and by no means an international program of revolutionary international Social-Democracy [8, pp. 759-761].

And then the hottest pre-revolutionary times came. One would think that the rhetoric and style of Lenin's articles should have become chaotic and less ordered; however, no — all the same sustained and balanced tone, the same unhurried, patient deep analysis, the unhurried course of the presentation of thought, which lead to the most correct remarkable conclusions, based by no means on unfounded calls and slogans, but on the ability to see the general objective behind individual specific facts, i.e. **to guess** and **expose** the regular in the process of building a dialectically verified scheme of analysis.

6. Small in volume, but extremely rich in *Content* and permeated through and through with the spirit of dialectics, the article "**On Dual Power**" [9, pp. 16-18] was written in April 1917. The fundamental question of any revolution, Lenin writes at the beginning of the article, is the question of power in the state. But the remarkable peculiarity of the current revolution is that it has created dual power, which no one thought of or could think of before. Therefore, the old "formulas" of Bolshevism must be supplemented and corrected. Dual power consists in the fact that next to the Provisional Government of the bourgeoisie, another government has emerged: the Soviets of Workers' and Soldiers' Deputies. Thus, there is a relation composed or formed of two sides-components: {"growing" government of the people in the face of the Soviets of Workers' and Soldiers' (i.e. peasants dressed in soldiers' uniforms) Deputies / government of the bourgeoisie}. The peculiarity of the people's power consists in the fact that it: firstly, represents a revolutionary dictatorship, since its source is not the law, but **the direct initiative of the masses from below**, i.e. revolutionary "seizure" [the source of power is some internal contentful (energetic) constituent of reality, determining the deep striving of the people (or a group of people); power itself is the external form of acquiring this contentful constituent]; secondly, it carries out the replacement of the police and the army by the armed people; thirdly, it places officials and the bureaucracy under the control of the armed people with the possibility of replacing personnel at the first demand of the people and paying labor no higher than the usual wage of a good worker [this extremely important and remarkable move (technique) of the nascent power was invented by no means by Lenin and the Bolsheviks, but was only successfully and justifiably implemented by the Bolshevik government after the victory of the Great October Socialist Revolution. This was an act approved by the people, in confirmation of the establishment of a more just distribution of the worked-out product. By the way, both the "Soviets" and our proud word "comrade" and many other similar fashionable terms and concepts of that time are also not inventions of Lenin and company, but verbal constructions corresponding to the achievements of the advanced enlightened thought of that time, skillfully used by the Bolsheviks in organizing the public arrangement of a new type]. Thus, a state is formed according to the type of the Paris Commune of 1871.

At the same time, this is only an embryonic power, for it still yields positions to the bourgeoisie. The reason is the insufficient consciousness and organization of the proletarians and peasants. The uncertainty of the new power is revealed by the simple question it poses: should the Provisional Government be overthrown

immediately? Lenin answers this question as follows: 1) the government must be overthrown — for it is oligarchic, bourgeois, and not nationwide, it can give neither peace, nor bread, nor freedom; 2) however, it cannot be overthrown now, for it is held together by a formal and actual agreement with the Soviets of Workers' Deputies; 3) it cannot be overthrown in the usual way at all, for it relies on the support of the bourgeoisie by the Council of Workers' Deputies, which is the only possible revolutionary government, directly expressing the consciousness and will of the majority of workers and peasants (and above, better than this type of government, as the Soviets of workers, farm laborers, peasant, soldier deputies, humanity has not developed and we still do not know). Hence, "to become power, conscious workers must win the majority over to their side: **as long as there is no violence against the masses, there is no other way to power**" [9, p. 18].

The bourgeoisie is for the sole power of the bourgeoisie, while the conscious workers are for the sole power of the Soviets of workers, farm laborers, peasant and soldier deputies, for sole power prepared by the clarification of proletarian consciousness and its liberation from the influence of the bourgeoisie, and not by adventures [i.e. the current relation from the indicated components (see above) must now be enriched with content, saturated with contentfulness by feeding its upper component, the "numerator", with *Content*, in order to strengthen it as the leading component by clarifying and enriching the proletarian consciousness].

Thus, as we see, again guided by the dialectical method, Lenin precisely and unambiguously determines both the relation of the main components-constituents of development at this particular stage of the revolutionary movement, and the actual class correlation of forces-components within the relation composed by him, which determines (we are talking about the correlation) the tasks for the near-term development of the revolutionary situation and the direction of the subsequent movement or change of this relation as a whole.

[This article is a classic example of skillful, filigree mastery of dialectics and its effective application].

7. In the article "**Three Crises**" [9, pp. 124-127], written by Lenin in July 1917, various forms of the course of the revolution are considered (primarily from class positions). Three objective political crises that determined the nature of the course of the revolutionary process of that period served as the basis for lies and slander [i.e. numerous "fakes", as they would say in our time] about the artificial organization of these crises by the hands of the Bolsheviks. Objectively common to all three crises is the "overflowing" discontent of the people with the bourgeoisie and its government, which allows us to see behind all this the incessant class struggle. Individually in these crises — these are different forms of conducting (manifestation) of the mentioned class struggle. In all three cases — this is a demonstration, but: in the first case — stormy-spontaneous, unorganized, leading to shooting at the demonstrators by the Black Hundreds; in

the second case — appointed by the Bolsheviks, canceled and postponed to a new date, a general more powerful demonstration with the predominance of Bolshevik slogans; in the third case — a spontaneous rise of counter-revolution contrary to the efforts of the Bolsheviks.

An instructive conclusion from the events under consideration, as Lenin notes, is "that all three crises show us a certain. new in the history of our revolution, form of a demonstration of a more complex type, with a wave-like movement [from extreme to extreme], a rapid rise and a steep fall, with an aggravation of the revolution and counter-revolution, with the "washing out", for a more or less long time, of the middle elements" [9, pp. 125-126].

Lenin masterfully notes that in such periods of acute political crises, the contradictions between the main "players" of the revolutionary action are aggravated [in this case between the components of the very main relation {proletariat/bourgeoisie}], while some intermediate "middle elements" accompanying every turmoil are pushed aside: "But the point is that this is not an ordinary demonstration, it is much more than a demonstration and less than a revolution. This is an explosion of revolution and counter-revolution together, this is a sharp, sometimes almost sudden "washing out" of the middle elements in connection with the stormy manifestation of proletarian and bourgeois [elements]" [9, p. 126].

The objective clash of two opposing sides, two classes — the proletariat and the bourgeoisie — corresponds to the political struggle of their parties — the Bolsheviks and the Cadets. At the same time, the "middle elements" accuse the Cadets that they facilitate the work of the Bolsheviks, and the Bolsheviks that they facilitate the work of the Cadets. Now, Lenin says, if instead of political names we substitute class ones, then we get the dreams of the petty bourgeoisie about the "disappearance" of the class struggle between the proletariat and the bourgeoisie. And then follows an objective and dialectically verified conclusion that no Bolsheviks in the world could have "caused" not only three, but even one "popular movement", if **the deepest economic and political reasons did not set the proletariat in motion**, that no Cadets and monarchists together can cause any movement "from the right", if equally **deep reasons did not create the counter-revolutionary nature of the bourgeoisie as a class** [9, pp. 126-127].

This is an indicator of the petty bourgeoisie's misunderstanding of the mechanism or essence of the class struggle of the proletariat against the bourgeoisie. Since the vast majority of the country's population is petty-bourgeois in their life situation and even more so in their ideas, and in the confrontation with large capital (in the face of banks and syndicates in the first place) the urban proletariat is not yet capable of immediately winning over the majority of the semi-proletarians and other strata of the population, such an objectively formed situation [corresponding to the objectively formed at the current moment correlation of force-components in the main class relation

{proletariat/bourgeoisie}] will be expressed in the inevitability of crises similar to the three crises under consideration in their three forms.

[Economic and political crises (the confrontation of two deeply non-equilibrium components of the known relation {proletariat/bourgeoisie}) set in motion both the revolutionary proletariat (with its form of government or power — the Soviets of workers', soldiers' and peasants' deputies) on the one hand, and the counter-revolutionary bourgeoisie (with its form of government — the Provisional Government) on the other. At the same time, the "middle elements" (petty bourgeoisie) with their parties (the Socialist-Revolutionaries and the Mensheviks) lash both of them for "rocking" the common boat. Behind the forms of the erupting crises, Lenin clearly sees their essence — the interaction, struggle, conflict of two components of development, two main sides of the relation {proletariat/bourgeoisie}. The middle elements or petty bourgeoisie (including the intelligentsia) are always an oscillating stratum, which, depending on the circumstances, can play the role of both a revolutionary-active and a counter-revolutionary element. And such oscillations from one pole to the other are inevitable, which leads to both a change in the established correlation between the sides and a change in the relation itself as a whole.

That is why, in the final analysis, for the implementation of a full-fledged uprising, the proletariat today lacks a "critical mass" and therefore the topical (for now) task is to win over the oscillating semi-proletarian mass to its proletarian side, including the poorest peasantry and the petty-bourgeois stratum of the country's population. In this case, we are talking about the need to increase the contentfulness of the "upper" component (the "numerator" of the given relation, i.e. the consciousness and organization of the proletariat) in the actually formed relation of components {proletariat/bourgeoisie} by all possible means, including explanatory work, agitation, and propaganda.]

8. Lenin's attitude to his probable arrest in the hot July days of 1917 will be shown by the example of the publications of two of his small articles "**Where is the Power and Where is the Counter-Revolution**" [9, pp. 119-123] and "**On the Question of the Appearance in Court of the Bolshevik Leaders**" [9, pp. 128-129].

In the first article, the false statement of a certain former member of the State Duma about the readiness of Lenin and the Bolshevik party to conclude a separate peace with Germany is analyzed, despite the fact that Lenin, on the contrary, has always and unconditionally rejected a separate peace with Germany in the most resolute and irrevocable manner [9, p. 121]. This same source reported that the Bolshevik leaders received money from German agents. At the same time, everyone perfectly understood that if this information were true, the General Staff would by no means allow its premature leakage to the yellow press and would not hesitate for a minute to arrest the Bolshevik top.

In fact, as it turned out later, taking advantage of dual power (or rather, the powerlessness of that period), this information for the purpose of discrediting the

Bolsheviks was spread by the so-called behind-the-scenes counter-revolution — the Cadets, well-known circles of the General Staff and the Black Hundred press. "The counter-revolution takes advantage of the powerlessness, uniting the Cadets with the well-known commanding tops of the army and with the Black Hundred press" [9, p. 123].

The second article on the question of the appearance of the Bolshevik leaders in court brings on this account, as one would expect, two opinions: to appear and not to appear. At first, Lenin very seriously considered the possibility of his presence in court, since such a step would allow using the court as a tribune to clarify the essence of the Bolsheviks' position and additional agitation, to which Ilyich always approached very scrupulously. Moreover, Lenin was by no means a man of a timid disposition to be frightened by threats from the Provisional Government. However, after a comprehensive collective discussion of this option, the VI Congress of the RSDLP(b) unanimously adopted a resolution in which it spoke out against the appearance of Lenin and a number of other comrades in court, foreseeing a possible massacre of the Bolshevik leadership [or, as they would say today, the neutralization of the entire party asset].

"If we assume that in Russia there is and a correct government is possible, a correct court, the convening of the Constituent Assembly is probable, then one can come to a conclusion in favor of appearance" [9, p. 128]. However, due to the absence of power [the established dual power as an equivalent to powerlessness], there was neither a correct court, nor a correct government, nor a Constituent Assembly in Russia at that time. The court is supposedly fair, the court will figure it out, the court will be public, the people will understand — "a reasoning naive to childishness". It is not a court, but a persecution of internationalists, that is what Kerensky and Co. needed. Therefore, "let the internationalists work illegally as much as they can, but let them not make the stupidity of voluntary appearance!" [9, p. 129].

[How honestly, responsibly and devotedly Lenin treated his cause, involving the implementation of the socialist idea in life, how convinced he was of the rightness of this idea, can be judged by the memoirs of his contemporaries, even from among those who were not Bolsheviks and never shared their views. The Menshevik F. Dan, for example, once remarked with irritation: "...There is no longer such a person who would be busy with the revolution 24 hours a day, who would have no other thoughts except the thought of the revolution, and who even sees only the revolution in his dreams. Just try to cope with such a one" [13, p. 6].

Can Lenin's devotion to the common cause, his lack of greed and purposefulness be compared with the qualities of today's "rulers" or the so-called Duma communists and all other "zealots for the people" — with their camouflaged financial assets, unaffordable real estate and "treacherously" tinted bank accounts (including foreign ones). It's laughable, really. Can the current "rulers" and their ilk compare with Lenin's pleiad of state leaders, who descended into

the grave in the same frock coats in which they came into the revolutionary political movement, and then into power?

Every "ruler" has, by and large, only two options for "exit" from power structures when the earth is shaking underfoot and power is slipping from his hands. The first option: to inconspicuously "merge", saving one's "hide" (in modern language), changing into a woman's dress or (which is tantamount to the same thing) timely pulling a retirement pajamas on oneself; the second option: again, saving one's precious hide, to apply force against the rebels.

Because his own "priceless" life and excessive ambitions are at stake, the modern "ruler" readily and without hesitation is ready to deploy against his own people artillery, tanks, MLRS and aircraft, perfectly realizing that all this is a weapon of group destruction. And how should one treat such a nonentity after that?

And against such a background, someone has the tongue to make claims to Lenin, who was not smeared and not noticed in anything similar (i.e., never clung to power and did not allow anything of the kind and close, which cannot be said about many other characters — once former and now residing in power). In this regard, Lenin was always guided by the principle formulated in one of his reports: "A revolution is worth something only if it knows how to defend itself...". It was about defense and the struggle against counter-revolution, which in every way and by all methods, including terror, sought to prevent the formation of a new social order (new socio-economic formation) and the creative transformation of the country: "The revolution was an awakening to a new life of millions. In February and March, these millions did not know what they were going to continue the slaughter into which they were driven by the tsars and Kerenskys and the purpose of which was exposed only in December by the Bolshevik government. This turning point has come; it changes the strength of the revolution. If these masses have now created a new discipline in the Red Army, not the discipline of the stick and the landlord's, but the discipline of the Soviets of workers' and peasants' deputies; if they are now going to the greatest self-sacrifice; if among them a new cohesion has developed, it is because for the first time in the consciousness and experience of tens of millions a new, socialist discipline is being born and has been born, the Red Army has been born. It was born only when these tens of millions of people saw from their own experience that they themselves had overthrown the landlords and capitalists, that a new life was being built, that they themselves had begun to build it and that they would build this life if a foreign invasion did not interfere" [12, pp. 122-123].

For the current "rulers", for example, special cycles of television programs are organized so that they explain their most "humane" and "sweet-tempered" impulses, talk about their grandiose plans, diligently winding flour products of well-known names onto the ear shells of undiscriminating or confused listeners. And as a result or in the dry residue, there will still be the same two options for "exit" from "power": either quietly "merge" in women's underwear or retirement pajamas, so that no one can "catch" the poor fellow for the miscalculations made

in foreign and domestic policy, or drown everything in human blood for the sake of one's own salvation. And there should be no illusions about this. Wretches of all stripes who have got into power use all possible means to stay afloat or get out dry.

Meanwhile, every such "ruler" should see at the end of his term of office not a comfortable armchair with a woolen blanket, but a block with an axe; only then can one hope that he will check every step he takes and make every decision in the name of and for the benefit of the people, who have temporarily delegated their power powers to him].

To our great regret, many modern "rulers" (including Russian ones) still, as in the past, build up for themselves, cherish and nurture oligarchic-plutocratic states: a) according to their perverted ideas of the ideal (in the sense of perfect) world order; b) as a natural product and indicator of their lack of education and bad taste. Moreover, to develop or "further educate" such a dwarf ruler due to his clinical limitations, as a rule, is not possible. All, outwardly looking like good intentions of such a worthless ruler, turn out, in the final analysis, to be just a cover for the manifestation of private property instincts, petty deeds and self-serving interests of the oligarchic-plutocratic environment, which serves for the caricature ruler as a kind of "airbag".

It is amusing to watch how an ordinary figure, after the insignificant sycophantic entourage "blows" into his ears about his non-ordinariness and exclusiveness, suddenly begins to claim the role of a large-scale theorist and teacher of the nation, practically not understanding the "sublime matters", looking down with disdain and hostility at the past of the country, leveling and calling into question what was created by truly great predecessors (during the years of Soviet power and under the leadership of the Bolsheviks hated by him). It is surprising how a "ruler" with an inadequate assessment of the phenomenal past of his people can throw dust in the eyes of his fellow citizens for so long.

In contrast to today's "leaders" and "rulers", the Bolsheviks (Lenin's closest comrades) evoke sympathy not only due to their education, erudition, lively mind, sober views of the world, but also thanks to iron will ("one could make nails from these people — there would be no stronger nails in the world"), romanticism (albeit naive to some extent), unwavering faith in the future, in man, in his creative potential.

The Bolsheviks from the pleiad of Lenin's closest comrades selflessly, at the cost of their freedom, health, and in many cases their lives, — managed to break through a gap in such a thickness of millennial human ignorance, deception and violence against ordinary people that it is simply impossible to reassess their contribution to the formation of a new worldview (world outlook and world order) and, therefore, one can admire them endlessly.

As for Lenin (as a politician and statesman), the decisions made by him and the actions performed by him must always and first of all be considered in the context of those tasks and problems that in those times, without exaggeration, simply "took by the throat". To understand the logic of decisions and behavior of great politicians, one must consider this behavior and decisions in accordance with the events and circumstances, conditions and realities that, like a certain spatial environment or atmosphere, fill those or other times.

By the way, modern political wretches, as already noted above ("true democrats" — by their own standards), for the sake of preserving their power or at the slightest threat to this power of theirs (as a rule, even in insignificant in historicism circumstances) easily use the power appropriated by them for the isolation or elimination of dissenters and freethinkers.

One must possess the true "greatness" and "enormity" of Lenin's nature to leave after himself such scanty autobiographical information from personal life, preferences, hobbies, etc. — unlike our current "rulers" striving to immortalize (with the help of court "chroniclers") and capture on film or "in digits" (in the form of a cinematic epic of insignificant episodes) every step of their feigned path under the pharisaic slogan "all life is service to the people"].

9. "Undoubtedly, the most important question of any revolution," V.I. Lenin begins his article "**One of the Fundamental Questions of the Revolution**" [9, pp. 208-214], dated September 1917. — is the question of state power; everything is determined by the class in whose hands the power is: one cannot bypass or postpone the question of power, for this is the fundamental question determining everything in the development of the revolution, in its foreign and internal policy. However, the revolution has lost half a year due to the hesitation of the parties of the Socialist-Revolutionaries and the Mensheviks, who are the avant-garde of the petty bourgeoisie with its economic instability in the struggle between labor and capital. If in these great half-years the petty-bourgeois democracy has learned anything, then it is necessary to immediately create a stable unhesitating power; if not, then the revolution has perished, and only the victorious uprising of the proletariat can save it" [9, p. 208].

Only the power of the Soviets can be stable, deliberately relying on the majority of the people, no matter how the lackeys of the bourgeoisie lie. Only Soviet power could be stable and could ensure the broad development of the revolution and the peaceful struggle of parties within the Soviets. Until such power is created, indecision, hesitation, endless "crises of power", a comedy of ministerial reshuffles are inevitable. But the slogan "All Power to the Soviets" is often understood completely incorrectly in the sense of "a ministry from the parties of the Soviet majority". In the indicated sense — this is just a change in the composition of ministers while preserving the entire old apparatus of government power, incapable of carrying out serious reforms.

In fact, "All Power to the Soviets" means a radical reworking of the entire old state bureaucratic apparatus that hinders everything democratic, the elimination of this apparatus and its replacement by a new, people's apparatus of the Soviets, i.e. the organized and armed majority of the people, workers, soldiers, peasants, providing the initiative and independence to the majority of the people not only in the election of deputies, but also in governing the state, in carrying out reforms and transformations [9, pp. 209-210].

The entire history of bourgeois-parliamentary and bourgeois-constitutional countries, Lenin reminds, shows that a change of ministers means very little, for the real work of management is in the hands of a gigantic army of officials, which is thoroughly imbued with an anti-democratic spirit, is connected by millions of threads with the bourgeoisie and is dependent on it. This army is connected by relations of rank worship, known privileges of "state" service, and the upper ranks of this army through the mediation of shares and banks are completely enslaved by financial capital, representing its agents, conductors of its interests and influence. [Isn't it somehow "peculiarly fresh" sounding today!]. To carry out reforms to limit the right of capital and the right of "sacred private property", such a state apparatus is absolutely incapable [9, p. 210]. It was so and it will be so as long as the bourgeois system holds and the old, bourgeois, bureaucratic, state apparatus remains inviolable. The Soviets of workers', soldiers', peasants' deputies are valuable precisely in that they represent a new, immeasurably higher, incomparably more democratic type of state apparatus [9, p. 211]. Here Lenin calls for not being afraid of the initiative and independence of the masses, who are capable of revolutionary transformations and replacing the old state apparatus.

Experience has shown that there is no middle ground: either all power to the Soviets both in the center and on the local level, or the landlords and capitalists hinder everything and restore their power. The situation in Russia is such that the unprecedented hardships and misfortunes of war, the formidable danger of collapse and hunger themselves suggested a way out and put forward as urgent reforms and transformations: the bread monopoly, control over production and distribution, limiting the issue of paper money, the correct exchange of bread for goods, etc. The only class that can show the courage and decisiveness that is lacking today is the proletariat; at the same time, the establishment of a firm course for reforms is impossible without the establishment of the dictatorship of the proletariat.

And, finally, the brilliant Lenin's conclusion: "Only the dictatorship of the proletarians and the poorest peasants is able to break the resistance of the capitalists, show truly majestic courage and decisiveness of power, ensure for itself enthusiastic, selfless, truly heroic support of the masses both in the army and in the peasantry" [9, p. 214]. The only thing that could make further development gradual, peaceful and calm is the transfer of power to the Soviets, which would mean the transfer of management of the country

and the economy to the workers and peasants, whom no one would dare to resist and who would quickly learn from experience to correctly distribute land, products, bread.

[So, again we return to the initial, revealed in the course of Lenin's analysis of the situation relation of component-classes {proletariat/bourgeoisie}, by the interaction of components in which some of their correlation is realized, demonstrating the supremacy, priority or prevalence of one component in relation to another (which determines the power of one class over another).

The relation {proletariat/bourgeoisie}, filled with new *content*, in the form of the transformed, transformed relation {Councils of workers', peasants' and soldiers' deputies / bourgeois Provisional Government} shows the ability of development (displacement) of this relation towards the "upper" component (the "numerator"), which corresponds to the strengthening of its activity, initiative and readiness for revolutionary transformations, to the perception and mastery of new forms of management, productive forces, social production, etc., etc., and which, in turn, determines the acceleration of the contentful development of the entire relation as a whole. The emergence of a new correlation of class forces to a new level of contentfulness (in the form of a new relation) — this is what the Socialist-Revolutionary and Menshevik leaders are afraid of. Again, the disruption of reforms by the bourgeoisie is the result of inactivity or lack of sufficient control over the situation on the part of the revolutionary component. The full development of the indicated relation as a whole is predicted by the transfer of power to the Soviets due to the readiness of the revolutionary popular masses for this.

In the same way, in modern conditions, without tough measures and a revolutionary approach to solving the most urgent state tasks, one cannot do without, no matter how hard one tries and no matter how one "blurs" the eyes of one's fellow citizens. If the current "ruler" hopes that everything will resolve itself, he is deeply mistaken in this regard — women have not yet learned to give birth to such oligarchs, magnates, majors and other "appropriators" who would voluntarily renounce what was earned in the sweat of someone else's face and in favor of their own face appropriated. It is a pity, nevertheless, that the current "governor" is not a resolute revolutionary.

The reverse side of any revolution, and then counter-revolution, is (along with class wars and squabbles) the settlement of personal, family, shop, corporate and other scores; at the same time, the following semantic chain is approximately realized: revenge => retribution => compensation => restoration of equilibrium (balance), i.e. justice... (the very etymology of words builds them into a similar semantic chain, corresponding to the direction of the course of processes of dialectical development). This is the external manifestation of the dialectical nature of developing reality in the field of human relations. At the "higher" levels — this is a contest of competing concepts and ideologies; at more "down-to-earth" levels — this is

a physical (force) struggle, conditioned by the desire (thirst) for the restoration of trampled justice, violated property (household) equilibrium. The mentioned chain can be clothed in a more attractive form, i.e. somehow ennoble, put on the clothes of legal laws, but it will never be possible to eradicate or abolish this chain, since in its depth, in essence — this is the same engine of *contentful* renewal, progress, development.]

10. The letter "**The Bolsheviks Must Take Power**" [9, pp. 325-327], addressed to the Central, Petrograd and Moscow Committees of the RSDLP(b), was written in September 1917. Here Lenin emphasizes that, having received a majority in both metropolitan Soviets of Workers' and Soldiers' Deputies, the Bolsheviks can and must take state power into their own hands. Having an active majority of the people (sufficient to break the enemy's resistance), proposing a democratic peace, giving the land to the peasants immediately, restoring the democratic freedoms trampled by the Kerensky government, the Bolsheviks will form such a government that no one will overthrow. One must not be deceived by the figures of elections to city dumas: only elections to the Soviets show the true, truthful correlation of forces (i.e. of components in the established relation-form {Soviets of Workers' and Soldiers' Deputies / bourgeois Provisional Government}) at the present moment. The people are tired of the hesitation of the Mensheviks and Socialist-Revolutionaries, and only the victory of the Bolsheviks in both capitals will draw the peasants after the Bolsheviks. Thus, the agenda should include questions about the armed uprising in Petrograd and Moscow, the conquest of power and the overthrow of the Provisional Government. In this regard, Lenin very aptly quotes Engels' words about the uprising: "Insurrection is an art" [17, p. 100].

"Having taken power at once in Moscow and Petrograd... we will win unconditionally and undoubtedly," Lenin concludes [9, p. 327].

[The establishment and "fixity" of a new correlation between the components in the notorious relation-form {Soviets / Provisional Government} (i.e. the statement of the fact of the majority of the people on the side of the Soviets) gives grounds for the conclusion about the relevance and legitimacy of a non-violent transition and transfer of all state power into the hands of the Soviets. A correctly performed assessment of the achieved correlation between the mentioned components in their established relation allows one to confidently forecast the course of the uprising and count on its most peaceful and bloodless outcome].

11. Another letter of Lenin to the Central Committee of the RSDLP(b) (known as an article under the title "**Marxism and Insurrection**" [9, pp. 328-332] and written approximately on the same days as the previous letter) was a reaction to the accusations of the Bolsheviks' adherence to the ideas of "Blanquism". These accusations arose on the basis of the Bolsheviks' attitude to the uprising as to an art (absolutizing allegedly the role of the subjective

beginning, which is characteristic of Blanquism, based, as is known, on the theory of conspiracies and terror).

Meanwhile, it was Marxism, according to Lenin, that called the uprising an art, explaining that the uprising must be treated as an art: to win the first success and from success to go to success, without ceasing the offensive against the enemy, taking advantage of his confusion and indecision, etc.

Fighting the accusations of Blanquism, Lenin determines the three main signs-conditions of success [i.e. of achieving the highest contentfulness by the forms-relations participating in the revolutionary process] of the uprising: firstly, reliance on the advanced class; secondly, reliance on the revolutionary upsurge of the people; thirdly, reliance on such a turning point in the history of the growing revolution when the greatest activity of the people is accompanied by the strongest fluctuations in the ranks of the enemies and indecisive "friends" of the revolution. "It is by these three conditions of posing the question of the uprising that Marxism differs from Blanquism," Lenin concludes [9, p. 328].

To prove the urgent necessity of the uprising from the point of view of the objective agenda, and not subjective conjectures, Vladimir Ilyich traces the change of objective conditions, the situation in the period of time from July to September of the same 1917, trying to identify the trend or direction of such changes. In July, in his firm conviction, the above-mentioned indispensable conditions for the success of the uprising were not yet observed, while by September the general picture had changed radically and now "all objective prerequisites for a successful uprising are evident" [9, p. 330]. Victory in the uprising, in Lenin's opinion, will disrupt Kerensky's game with the surrender of Petrograd and the conclusion of a separate peace with Germany against the revolution and will ensure the conclusion of a more complete, open, fair peace in favor of the revolution. Only the Bolshevik party, having won in the uprising, can save Petrograd from surrender to the Germans and save the whole of Russia from the separate division by the imperialists of both warring coalitions. The Bolsheviks must draw up a short declaration, insisting on the necessity of immediate actions for the sake of saving the revolution, the necessity of a complete break with the bourgeoisie, the complete removal of the current government, the complete break with the Anglo-French imperialists preparing a separate division of Russia, the necessity of an immediate transfer of all power into the hands of the revolutionary democracy led by the revolutionary proletariat. The short and sharp declaration must contain two most important points: 1) the people are tired of the hesitation and indecision of the Socialist-Revolutionaries and Mensheviks and therefore breaks with these parties finally, for they have betrayed the revolution; 2) a break with the allied imperialists and a proposal for peace without annexations lead either to an immediate truce or to the transition of the revolutionary proletariat to defense and waging a truly fair revolutionary war under its leadership. Having published the declaration, the Bolsheviks must put their entire faction forward to the factories and barracks

— that is its place, there is the nerve of life, there is the source of salvation of the revolution. Posing the question in this way, the Bolsheviks will be able to correctly appoint the moment of the beginning of the uprising, having previously organized the headquarters of the rebel detachments, mobilized the armed workers for a desperate last decisive battle, occupied the telegraph, telephone and connected all factories, all regiments, all points of armed struggle with the headquarters, etc. [9, pp. 331-332].

[Thus, the transfer of accents and the shift of the correlation of components in the known relations towards more contentful, active and active components and thereby bringing these relations to the form {Soviets (under the aegis of the Bolsheviks) / Provisional Government (in alliance with the bourgeoisie and foreign financial capital)} changes the entire tactics of the Bolsheviks in the conditions of the growing revolutionary movement. In other words, speaking in everyday language, the first revolution of the proletariat, the peasantry and the bourgeoisie in alliance with the Anglo-French financial capital against tsarism before our eyes is growing into a revolution of the proletariat and the poorest peasantry against the bourgeoisie with its ally the Anglo-French financial capital and the Kerensky government].

As has already been shown earlier, a similar schematically-described above plot construction can be seen in almost all of Lenin's theoretical works. Thus, we have some grounds for building and formulating a methodology (or even a whole methodology) for researching the perspective of the movement-development-change of the forms-relations of interacting components in different areas and at different levels of reality.

12. The article "**On Compromises**" [9, pp. 158-163] was printed on September 19, 1917 in connection with the opened opportunity for the Bolsheviks to conclude a voluntary compromise with a number of other parties.

"A compromise," Lenin writes, "is called in politics the concession of some demands, the renunciation of part of one's demands by virtue of an agreement with another party" [9, p. 158]. The usual idea of the Bolsheviks was that the Bolsheviks do not agree with anyone and never on any compromises. Such an idea is flattering, for even enemies are forced to recognize the party of the revolutionary proletariat's fidelity to the principles of socialism and revolution. However, to tell the truth, such an idea does not correspond to the truth. The task of a truly revolutionary party consists not in not succumbing to compromises, but in being able, through all compromises, to maintain fidelity to its principles, fidelity to its class, its cause of preparing the revolution and the corresponding education of the masses.

The Bolshevik party, like any other, strives for political domination for itself in the name of achieving its goal; the immediate goal for the Bolsheviks is the establishment of the dictatorship of the revolutionary proletariat. And

yet, in the current conditions of the original turn of the Russian revolution, the Bolsheviks (as a party) can offer a voluntary compromise, however, not to the bourgeoisie (i.e. the main class enemy), but to the Socialist-Revolutionaries and Mensheviks (the dominant petty-bourgeois democratic parties). Now within a very short period of time it is possible to return to the slogan "All Power to the Soviets"; at the same time, the government responsible to the Soviets will consist of the Socialist-Revolutionaries and Mensheviks. Such a combined variant could ensure with a gigantic probability the peaceful movement forward of the entire Russian revolution and extremely high chances of the worldwide movement towards peace and the victory of socialism. "Only in the name of this **peaceful development of the revolution** — an opportunity, extremely rare in history and extremely valuable, an opportunity, exceptionally rare, only in its name the Bolsheviks, supporters of the world revolution, supporters of revolutionary methods, can and must, in my opinion, go for such a compromise" [9, p. 159].

[And again Lenin, as a true dialectician, discovers a certain new (capable of functioning effectively) relation of components {Soviets / government of Socialist-Revolutionaries and Mensheviks}, the correlation of which at that given particular moment would contribute to giving an additional impetus to the prospective revolutionary movement].

But such an outcome was possible at the moment Lenin was preparing this article. However, literally a couple of days later, the situation began to change rapidly and the events that occurred showed that the proposal for a compromise was already late; the few days during which peaceful development would still have been possible had passed. It became obvious that due to the inaction of the Socialist-Revolutionaries, the favorable "days when the road of peaceful development became possible by chance, have already passed" [9, p. 163].

13. The article "**An Outsider's Tips**" [9, pp. 391-393] was written on the eve of the Great October Socialist Revolution. The current situation makes it clear that in the conditions of the greatest sympathy and support for the revolutionary-proletarian (Bolshevik) power on the part of all workers and exploited people in the world in general, and in the warring countries in particular, and among the Russian peasantry in particular — all Bolsheviks should be quite clear: the transfer of power to the Soviets now means in practice an armed uprising. To renounce the armed uprising is tantamount to renouncing the main slogan of Bolshevism — "All Power to the Soviets". And here Vladimir Ilyich again insists on the well-known Marxist thesis: "Armed uprising, like war, is an art" [9, p. 391]. Marxism formulates the following main rules of this art: 1) having started the uprising, one must firmly go to the end; 2) in the decisive place and at the decisive moment, it is necessary to gather a large superiority of forces; 3) defense is the death of an armed uprising — one must necessarily go over to the offensive; 4) one must try to take the enemy by surprise; 5) to achieve small successes daily and move from success to success, maintaining at all costs the "moral superiority".

In the adaptation of these general rules to the specific situation, Lenin highlights the following points: 1) the organization of a sudden and rapid offensive on Petrograd both from within and from outside with the aim of creating a gigantic superiority of forces, paralyzing the response actions of the Junkers, and thereby achieving the bloodlessness ("low-bloodedness") of the uprising; 2) by the three main revolutionary forces (the fleet, workers and military units) the main objects must be taken under control and held at any cost: telephone, telegraph, bridges, railway stations; 3) the formation of small detachments from the most resolute and steadfast comrades, ready to provide operational support in the most important directions.

[Here we see that without any reservations or delays, Lenin finally bets on the new correlation of components and the superiority of the "Soviets" component (i.e. the predominance of the "numerator" over the "denominator") that had developed by that time in the relation {Soviets / Provisional Government} and on this basis plans the success and the acquisition of a new quality by the indicated relation in its transformation into a more *contentful* and prospective form.]
According to the circumstances that had developed then, Lenin believed that "the success of the Russian and world revolution depends on two or three days of struggle" [9, p. 393].

§ 3. Works of the post-revolutionary period

The Great October Socialist Revolution has been accomplished. The Bolsheviks took power, but it did not become calmer or simpler. The agenda includes new topical questions: how to hold power, how to suppress the resistance of the counter-revolution, how to move on to building a peaceful life, how to awaken the creative initiative of the masses, etc.

1. In the article "**Speech on the Nationalization of Banks at the Meeting of the All-Russian Central Executive Committee on December 27, 1917. Protocol Record**" [9, pp. 462-464], published on December 29, 1917, it is about the opposition of the new power of the Soviets by the old bourgeois bureaucratic apparatus. The old apparatus with all its might tries to present the banking issue as extremely fragile, complex and confusing, in order to maximally slow down the process of transferring affairs into the hands of representatives of the new power and to hinder all socialist undertakings. Regarding all decisions of the Council, they ["apparatchiks"] declare that they agree, but only in principle. The entire system of bourgeois intelligentsia, in Lenin's opinion, is distinguished by "its constant agreement **in principle** and disagreement **in practice**", which ruins the whole cause [9, p. 462].

From the very first days, the new power faces opposition, when its decisive steps are approved in theory and nothing but sabotage is met in practice. No one (except utopian socialists) had previously claimed that it is possible to

win without resistance and without establishing the dictatorship of the proletariat; and this fundamental point was not disputed by anyone. But when the word "dictatorship" is translated into Russian and its equivalent "iron hand" is reached, then all the former zeal disappears somewhere and lamentations begin about the fragility and confusion of the issue [all the pressure is suddenly leveled and nullified by referring to the complexity and confusion of issues]. *However, here one must see that this iron hand, destroying, also creates*.

After all, at first there was talk of an agreement with the banks ("who wants to work — you are welcome"), they were issued loans for financing enterprises, but they started sabotage of an unprecedented size, and practice led the Bolsheviks to exercise control by other measures. Now the words "dictatorship of the proletariat" are spoken by the Bolsheviks very seriously, and this dictatorship will be implemented.

2. And then, on the hot heels, "**A draft decree** ["road map", as they would say today] **on the implementation of the nationalization of banks and the necessary measures in connection with this**" was created and submitted by Lenin for discussion by the bureau of the Supreme Council of the National Economy [9, pp. 465-467], which determined the direction of movement and transformations of the banking sector for the near future and many years to come. Delay with the approval of the decree was already tantamount to the disruption of the entire economy due to the powerful opposition and sabotage on the part of the banks.

In the preamble to the mentioned Draft Decree [9, p. 465], it is said about the critical food situation and the threat of famine generated by the speculation and sabotage of capitalists and officials, which leads to the need to take extraordinary revolutionary measures to combat this evil. So that all citizens of the state and, first of all, the working classes under the leadership of their Soviets of workers', soldiers' and peasants' deputies could immediately, "stopping at nothing and acting in the most revolutionary way, take up such a struggle and the establishment of the correct economic life of the country, the following rules are established", which are further set out in the body of the Draft Decree [below are the rules that, in our opinion, are of the greatest interest to us today from the point of view of their continued effectiveness to this day.]

- All joint-stock enterprises are declared the property of the state.
- All shareholders "belonging to the rich classes" are obliged to continue managing the affairs of enterprises, providing weekly reports on their activities to the local Soviets.
- Government loans (external and internal) are annulled, but the interests of small owners of bonds (as well as shares) belonging to the working classes of the population are fully secured.

- Universal labor conscription is introduced, when all citizens of both sexes, from 16 to 55 years old, are obliged to perform work assigned by the local Soviets.
- For correct accounting and distribution of food and other essential products, all citizens of the state are obliged to join some consumer society and perform the work that will be imposed on them by the Soviets.
- Unions of railway workers and employees are obliged to urgently develop and immediately begin to implement emergency measures to provide transport, especially for the delivery of food, fuel and other essential items. The duty of waging a merciless struggle against speculators is also imposed on them.
- "Persons of the rich classes" are obliged to keep all their money sums in the State Bank, its branches and savings banks, receiving for consumer needs the sums established by the local Soviets; sums for production and trade needs can be obtained only with written certificates from worker control institutions; "those guilty of deceiving the state and the people will be subject to confiscation of all property".
- "The same punishment, as well as imprisonment or sending to the front and to forced labor, is subject to all disobedient to this law, saboteurs and striking officials, as well as speculators. The local Soviets... are obliged to urgently develop the most revolutionary measures of struggle against these real enemies of the people."
- Trade unions and other organizations of workers in conjunction with the local Soviets organize flying groups of controllers from the most reliable and recommended by party organizations persons to monitor the implementation of this law, to check the quantity and quality of work and to bring to revolutionary courts those guilty of violating or circumventing the law.
- "Workers and employees of nationalized enterprises are obliged to strain all forces and take emergency measures to improve the organization of work, strengthen discipline, increase labor productivity. The bodies of worker control must provide weekly reports on what has been achieved in this regard. For shortcomings and omissions, the guilty are answerable before the revolutionary court" [9, p. 467].

[And again the contradictory question requires a solution — finding the correct correlation of components-constituents in the relation {dictatorship of the proletariat / soft government apparatus of indecisive bourgeois intelligentsia}. The "iron hand" or the dictatorship of the proletariat is precisely that rigorous accounting and control over production and distribution, which must be strictly exercised not only in wartime conditions, but throughout the entire period of socialist construction, until the principles of morality, ethics, honest attitude to work enter the blood and flesh of every person — both at the level of conscious perception and at the level of the subconscious. The tricks of bourgeois games described in the article were revealed by the Bolsheviks in the first months of the functioning of Soviet power, which is why decisions were made to act in response quite harshly and immediately, **so that the previous sacrifices and efforts would not be in vain.**]

3. In the article "**How to Organize Competition?**" [9, pp. 468-476], written in January 1918, the conditions for awakening genuine competition to life, as well as the initiative of the masses, are considered.

Already at the dawn of the emergence of capitalist relations, the competition of small commodity producers could on a somewhat wide scale educate enterprise, energy, the boldness of initiative; in fact, today capitalism has replaced small independent production with the largest factory production, joint-stock enterprises, syndicates and other monopolies. Competition in this layout means, on the contrary, the suppression of the enterprise of the mass of the population, the replacement of competition with financial fraud and servility to the "tops" of the social ladder [9, p. 468]. [How amazingly accurately and fairly this "sounds" in relation to the rampage of the wildest capitalism in modern Russia and in the post-Soviet space!].

To develop abilities, to reveal human talents (which the people have in abundance) on a mass scale is possible only with a properly organized socialist method of production. The most urgent task today, when the socialist government is in power, is to organize competition.

[It is striking how from the very first days of Soviet power, in the conditions of an economic chaos, collapse, and famine that have not yet been overcome, Lenin thinks in categories of the most peaceful and calm time, in categories of education and formation of new production relations between workers, awakening the initiative of people on a "mass scale"!].

"A broad, truly mass creation of the opportunity to show enterprise, competition, a bold initiative is only now. ...For the first time after centuries of work for others, forced work for exploiters, the opportunity to work for oneself arises, and moreover work based on all the achievements of the latest technology and culture" [9, p. 469].

It is quite clear that the greatest change in history of mankind from forced labor to labor for oneself cannot occur without conflicts, without overcoming the resistance of exploiters, without displacing the capitalists, which will take time. In addition to the "military" measures of suppressing the resistance of the "rich classes", the proletariat and the poorest peasantry will also need huge organizational efforts. Thus, the organizational task is intertwined with the task of ruthless military suppression of yesterday's slave owners (capitalists and their **lackeys** — the gentlemen of **the bourgeois intelligentsia**).

Naturally, none of the past "masters of life" wants to voluntarily part with their former command and "bread" privileged posts, considering themselves "God-chosen" patrons and managers over the people. "But the matter of the exploiters and their intellectual lackeys is a hopeless matter." Their resistance, workers and peasants will eventually break decisively and ruthlessly.

Intellectuals accustomed to serving capitalists and the capitalist state believe that they cannot be done without. "Their impudent calculation will not be justified: educated people are already standing out, going over to the side of the people, to the side of the workers, helping to break the resistance of the servants of capital. And there are many organizational talents in the peasantry and the working class, and these talents are just beginning to realize themselves, to wake up, to reach for living, creative, great work, to take up the construction of a socialist society independently" [9, p. 470].

Perhaps the most important task today, Lenin says, is to develop as widely as possible the independent initiative of workers in the matter of creative organizational work. It is necessary to break the vile and absurd prejudice that only the so-called "higher classes" and only the rich can manage the organizational construction of society. Organizational work is "within the power of an ordinary worker and peasant who has literacy, knowledge of people, practical experience. ...There is still an inexhaustible spring and a richest spring of such talents in the working class and in the peasantry." Workers and peasants are still timid, they have not yet got used to the fact that they are now the ruling class. But the strength and vitality of the October Revolution of 1917 lies in the fact that it leads the working people to the path of independent creation of a new life.

[For the note of the current "rulers" and their ilk: Lenin in a matter of years found ways from scratch to motivate the illiterate, bast-shod population of the bloodless country, and the current "ruler" with his "valiant" arrogant entourage has been struggling for several terms (both in a row and intermittently) to solve the same task, but in vain.

The conservative "comprador" entourage of the current "ruler" will not allow him (the ruler) to make a single decision encroaching on the self-serving interest of this entourage. So all this pompous camarilla will sit and wait for mythical Western investments like manna from heaven, shifting the blame for their failure on the notorious Western sanctions. Fortunately, their own fortunes are reliably placed in foreign lands with the hope that such ugliness will continue forever.

For the information of today's "rulers": Lenin, in the five or six years granted to him after the revolution, managed (in the conditions of discord and devastation, having tried many options) to find ways to awaken both enthusiasm and the initiative of millions, and to attract foreign specialists, and to train and prepare his own... Human potential (physical strength, intellectual and spiritual energy of the people) — this is the source of all investments, technologies and innovations, and therefore the main component of the country's economic success; however, the inept "comprador" entourage of the supreme "ruler" will skillfully, on the verge of sabotage, extinguish this potential and write off all failures to the lack of overseas investments and the omnipotence of overseas sanctions.
By the way, has the main "ruler" tried to pull "overseas investments" out of the purse of his entourage?

Regarding the liberal-minded (in relation to the aggressive collective West) circles in Russia, it is somehow already old-fashioned, unpleasant, and not desirable to speak. Since the words of F.M. Dostoevsky, it has been known that "our Russian liberal is first and foremost a lackey and only looks for how to clean someone's boots" [4, p. 133]. Meanwhile, eternal kneeling before the West is conditioned by the universality and generality of the very principle of *self-development*.

The aspiration of all forms to the highest contentfulness has an unsightly reverse side in **the imposition** (as a sample or standard) of its allegedly most perfect and exclusive form — its understanding of the world, its ideology (with the accompanying "uprooting" of dissent and everything "wrong"), its worldview, world outlook, world perception, its way of life — and all this is presented as an indisputable absolute truth. The Anglo-Saxon world has since time immemorial professed an aggressive way of interacting with other peoples or representatives (carriers) of a different principle, as, for example, the peace-loving and more balanced Eastern Slavic peoples, who always act as a pacifying counterweight to restrain and neutralize such excessive activity (aggressiveness) of the Anglo-Saxons and their ilk.

Anglo-Saxon communities and their accomplices (in aggregate — the collective West) feel themselves at the same time champions and bearers of good, enlightenment, civilization, morality, ethics, etc.; they are always charged with the ideology of the expansion of everything, in their assessment, "good" against everything "bad" or "good" (according to their understanding) against "evil". Our liberals are led by this bait or false bait; persons with liberal views are very one-sided and superficial in their perceptions and beliefs, since they take the brilliant external packaging for the most part as the deep hidden essence of things.

In addition, the aggression inherent in the Anglo-Saxon "mentors" and Co. is further enhanced due to a number of "misses" pursuing them, i.e. due to receiving periodic spankings and thrashings from the Eastern Slavs in response to their excessive zeal in carrying out incessant attempts at forcible "enlightenment" and "ennoblement" of the latter; therefore, they always have an unquenchable vulnerability due to their unchanged status of the "eternally beaten" in open clashes. It must be said straight out that these "highly civilized" peoples have never been able to correctly assess their contentful resource, i.e. to measure their capabilities against the potential of the Eastern Slavs, which is why they suffered defeats from them time and again.

The collective West led by the US bets (unconsciously, of course) on the perfection of the *form* (i.e. mainly on the *formal* principle), while ignoring the development of the *contentful* side-constituent. This is the secret of their certain technological advantage (quality of household items, equipment, services, etc.), achieved by focusing on the ***Form*** (sometimes more or

less *contentful* only from the perspective of short-term success and *contentless* from the point of view of strategy and deep, long-term perspective of the development of mankind). It is still necessary to thoroughly "dissect" the dry calculating intellect of the Anglo-Saxon world — this *formal* constituent, this *formal* principle of the universal human world — in order to understand the danger of such a one-sided approach on the scale of the development of all mankind. In their prevailing *mechanicity* and *technological inclinations* (i.e. a bias towards the technological side, often devoid of moral underpinnings and moral attitudes) lie all the explanations of their modern actions and behavior. None other than they have become today the first managers and manipulators of public consciousness on an unprecedentedly massive, global scale, through the Internet, and in particular through social networks and platforms. In all their policy (foreign, internal, technical, technological, social, etc. — especially against the background of the not so long ago once again proclaimed by Obama their imaginary and illusory exclusivity) there is something school-boyishly well-calculated rational and at the same time humanly extremely primitive and limited (the analogy with cold-blooded "reptiloids" trying to impose their way of life and behavior on warm-blooded earthlings suggests itself).

Here it is also appropriate, in our opinion, to touch upon the question of the imposition on the whole world by the collective West of its allegedly most progressive and most democratic "values" and preferences. First of all, it is necessary in this regard to point out the entrenched confusion in the interpretations of the terms "values" and "interests". This confusion is due to the incompetence of the "interpreters" in terms of the correct correlation of these concepts with two different, non-identical spheres of acquiring reality (in the composition of the multi-level form of man): the sphere (level) of the "sensual" and the sphere (level) of the "ideal". It must be said that such issues have long and deeply been analyzed by famous philosophers of the past, but the solutions to these issues have been quite successfully and thoroughly forgotten by our contemporaries. If we talk about "values" in the meaning and sense invested in this concept by the Western world, then we are talking mainly about primitive interests limited to the sensual sphere of man. In this section, all the efforts and aspirations of the Western philistine are aimed mainly at the implementation of quite "down-to-earth" and simple human needs (in food, housing, source of income, in procreation, rest, as well as in the satisfaction of various physiological desires, pleasures, fantasies, requests for boundless rights and freedoms, etc.). The concept of "values" from the point of view, for example, of a Russian person is by no means limited to the sensual sphere, but goes ("protrudes") beyond its limits into the realm of the ideal; and in this sense it is already identified with spiritual categories (which for their more accurate identification and binding require different, more ***Contentful*** terminology): with principles, with convictions, with ideals, with worldview, etc., etc., — i.e. with forms-attributes of a higher level of acquiring reality, called human consciousness. In this sense and in this hypostasis — this is no longer an orientation towards low-level "values" of the Western world, but a conscious adherence to

more *Contentful* views: principles of human morality, ethics, spirituality, humanism, etc. In the main and the big, the modern West (unlike, say, Europe of the Enlightenment) is devoid of aspiration to proclaim and follow (including in everyday life) high spiritual principles and convictions — it simply got stuck on "down-to-earth" needs and low-grade interests, ***refusing further movement towards ideals developing a person***. It is precisely for this reason that all the teachings and instructions of the Western world regarding the unquestioning acceptance and "implementation in life" by other peoples of the line of Western, so to speak, "values" look at least ridiculous and laughable.]

At the same time, implementing socialist undertakings, the Soviets of workers', soldiers' and peasants' deputies, consumer societies, supply unions, factory committees and worker control bodies must understand that the main economic task at this stage is **accounting** and **control**. The old habit of a forced person is still strong — as if to "grab" at least a piece from the bourgeoisie, without burdening oneself with extra work and obligations. Such an approach of "newcomers" to the factory environment: "Grab a bigger piece and run away", — is transferred to the factory that has passed into the ownership of the people. The advanced conscious workers have already started fighting against such personnel, who will undoubtedly be supported by honest, thinking peasants. Universal, universal, universal accounting and control over the distribution of products and the amount of labor — this is the essence of the socialist transformation; the accounting and control necessary for the transition to socialism can only be mass.

Proceeding from this, Lenin turns to the new working owners of land, banks, factories and plants: "Take up the accounting and control of production and distribution yourselves, — this is the only way to the victory of socialism, the pledge of its victory, the pledge of victory over all exploitation, over all need and poverty". In Russia, Lenin says, there is enough bread, iron, forest, wool, cotton and flax for everyone, if a nationwide businesslike, practical control over distribution is established, if the enemies of the people (the rich and their "hangers-on" — bourgeois intellectuals) are defeated not only in politics, but also in the everyday economic life of a society in which "a handful robbed the people and mocked the people" [9, p. 472]. [An extremely topical appeal also applicable to the current situation in Russia!].

"The rich and crooks, these are two sides of the same coin, these are the two main categories of parasites fostered by capitalism, these are the main enemies of socialism, these enemies must be placed under the special supervision of the entire population, they must be dealt with, at the slightest violation by them of the rules and laws of socialist society, mercilessly. Any weakness, any hesitation, any sentimentality in this regard would be the greatest crime against socialism" [9, p. 473].

[If only Lenin with his dialectical mind were here, even for an hour !!!

Our great Motherland has again been turned into a country of lackeys and masters, where a handful of plutocrats does at an unconscious level everything that comes to mind, satisfying primarily their primitive momentary whims and fancies, dictated only by the desire to increase their own savings, thereby determining and setting in advance, for years, the configuration of our (or rather, their) future and without our participation in this. Before, such a thing could not even be dreamed of or seen in a nightmare. **Lenin's lessons of dialectics have turned out to be, at best, *Unlearned lessons of dialectics.***]

The way to neutralize these parasites is a nationwide, organized by millions of workers and peasants, voluntary and energetic accounting and control over the amount of labor, production and distribution of products. And in order to organize this accounting and control, which is quite accessible and feasible for every honest, sensible and efficient worker and peasant, it is necessary to call their own organizational talents to life, it is necessary to establish on an all-state scale a competition in terms of organizational successes, it is necessary that workers and peasants clearly understand the difference between the necessary advice of an educated person and the necessary control of a simple worker and peasant over the sloppiness, so common among educated people.

Sloppiness, carelessness, untidiness, "the tendency to take on everything in the world and bring nothing to an end is one of the properties of "educated people", stemming not at all from their bad nature, much less from malice, but from all the habits of life, from the setting of their work, from overwork", from the abnormal correlation of the mental and physical components of labor in the cycles of their activity, etc., etc.

[And here we see a surprisingly insightful and precise statement of the connection between the actual mistakes, shortcomings and misses made during the revolution and those "sad, but inevitable" at that moment above-mentioned "properties of intellectuals", as well as the lack of sufficient control from the workers over the organizational work of intellectuals. Most of all, hesitation and indecision, which are so characteristic of the intelligentsia and which the intelligentsia is guilty of, are unacceptable to Lenin.

Any hesitation after the adoption of a collective decision was tantamount to betrayal and defeat for Lenin. Ilyich is always tuned and charged for victory. The same applies to compromises (namely in relation to his ideological opponents), to which the bourgeois intelligentsia is most inclined, being weak in spirit (i.e. not having fundamental ideological convictions). Lenin also includes here the desire to sit on two chairs; nowadays — this is the notorious political "multi-vector". Indecision and hesitation, in the end, often turn into extra unnecessary victims; these are those absurd mistakes that could have been avoided by adhering to a firm position. The enemy is like an uncomfortable hard, but "firm ground", and the wavering and indecisive

"fellow traveler" is akin to a swamp: try to know when it will "absorb" and "digest" you, i.e. simply betray.

In modern Russia, the role of the petty-bourgeois wavering conciliators with those in power is played by "pocket" parties and groups like modern centrists, communists, liberals of all names, etc., with a vague position — declassed elements, dangling somewhere "between here and between there"; the place of the actual spokesman for the opinions of the working class of wage workers remains vacant as before. In general, regarding the betrayal and apostasy of the intelligentsia, when the cause of a whole life is threatened, anyone would speak even more harshly and emotionally than Vladimir Ilyich does.

As in the times of V.I. Lenin, modern political and economic literature is full of all kinds of absurdities: and some "middle class" was invented, and ownership of the means of production no longer has any significance, and a two-party system is strictly obligatory for progress, etc. If you come to think of it, any person always has an internal *content-form* (i.e. at least two-component, two-sided, dual) contradiction, which serves as the engine of all progress and development even more fiercely than the contest, competition or conflict of two or several parties; in one person, opposing components can be observed and coexist, giving such an impulse of activity that no parties are needed at all.

As they say in Russia: "In Russia there is still one party — it is just called differently." However, something similar is observed in other countries. For example, in the USA, liberals and conservatives (Democrats and Republicans) have long been fighting for power only for the sake of protecting and increasing the property and income of the propertied class. In addition, one must always be prepared for the fact that over time the "bourgeoisification" of the most advanced and progressive parties at first occurs due to the degeneration of the top and part of the members of these parties into their opposites — such is the dialectical nature of reality: one just needs to recall this more often and shake up (clean out, as Lenin said) the party ranks.

As in the times of Lenin's pre-revolutionary political activity, today, to curb the threat of stratification and radicalization of society, the bourgeoisie sometimes try to integrate the topmost layers of the left and anarchists into their system, recruit them into their ranks (having bought them off with an insignificant increase in the wealth tax or small concessions and benefits in the social sphere, etc.).
What kind of opposition is it in parliament if it consists of the power-fed representatives of the same "bourgeoisified" class as the official propertied ruling class? Where does the dividing line pass between the official power and the systemic alleged opposition, among the leading members of which the owners and co-owners (shareholders) of "factories, newspapers, steamships" with assets placed outside the borders of our Motherland suddenly find themselves by chance?]

"Intellectuals give the most excellent advice and guiding instructions all the time, but they turn out to be ridiculously, absurdly, disgracefully "armless", unable to put these advice and instructions into practice, to exercise practical control over the fact that the word turns into action. This is where it is impossible to do without the help and without the guiding role of practical organizers from the "people", from the workers and working peasants" [9, p. 474]. In this regard, competitions of practical organizers from workers and peasants with each other should be organized, to fight against any "stamping" and attempts to establish uniformity from above, to which intellectuals are so prone.

And then follows an "absolutely dialectically" built semantic, in some ways final construction on the topic of the detailed conversation conducted in the article, giving an idea of the presence of an objective natural direct connection between the *contentful* and *formal* components of this construction, which serves as the brightest confirmation of its dialectics, and, consequently, its truthfulness: "**With democratic and socialist centralism, stamping or establishing uniformity from above has nothing in common. Unity in the main, in the root, in the essential is not violated, but is ensured by diversity in details, in local features, in approaches to the matter, in ways of exercising control**, in ways of destroying and neutralizing parasites (the rich and crooks, slops and hysterics from the intelligentsia, etc., etc.)".

[Ah, if Ilyich were with us throughout the entire period of socialist construction, what unforgivably gross mistakes we could have avoided in order not to betray the most fruitful idea and not to deviate from this path! Dialectics is the skill or art of balancing on the razor's edge, to walk on the sharpest blade without cutting and without falling to either side. At the same time, this is not eclecticism and by no means the ability to sit on two chairs at once (not adherence to the so-called multi-vector).]

The Soviets of working people's deputies must follow the path of combining, on the one hand, the initiative, independence, freedom of movement, energy from below and, on the other hand, voluntary, alien to templates, centralism. It is necessary that any and every commune (factory, village, consumer society, supply committee) should come out, competing with another commune, as a practical organizer of accounting and control over labor and distribution of products. The communes themselves must develop and test in practice thousands of forms and methods of practical accounting and control over the rich and crooks. "**Diversity here is a guarantee of vitality, a guarantee of success in achieving a common single goal**. ... The more diverse, the better, the richer the general experience will be, the more reliable and faster, the easier the practice will develop — for only practice can develop — **the best** methods and means of struggle" [9, p. 475]. The competition of communes, communities, consumer-production societies and partnerships, Soviets of workers', peasants' and soldiers' deputies should

develop on the issues of eliminating hunger, unemployment, eradicating the rich idlers, scoundrels from the lackeys of the bourgeoisie, saboteurs (calling themselves intellectuals), on the issues of increasing labor productivity, building new good houses for the poor, housing the poor in the houses of the rich, supplying a bottle of milk to every child from poor families. It is in the course of this work that organizational talents, which are abundant in the people, should be practically singled out and promoted to the top, to the bodies of all-state administration. "They need to be helped to unfold. They and they alone, with the support of the masses, will be able to save Russia and save the cause of socialism" [9, p. 476].

[And again, new optimal (best) relations with new components are being sought and found: {emancipated creative labor / socialized socialist enterprise}, {organizational talent of the working people / accounting and control over production and distribution}, {knowledge and experience of an educated employee (intelligentsia) / control and efforts of a simple worker regarding the eradication of sloppiness and irresponsibility of an educated employee (intelligentsia)}, {initiative and initiative of workers on the ground / voluntary democratic socialist centralism}, — the correlations of which at this particular moment (in contrast to the previously established relations with known components {wage labor / capital}, {proletariat/bourgeoisie}, {competing diversity/monopoly}, {enterprise / established bureaucratic order}) can give an additional impetus to the further revolutionary movement. Thus, the task of reaching new correlations of components in such more general relations as {theory/practice}, {mental labor / physical labor}, etc. is implicitly solved.]

4. The article "**The Main Task of Our Days**" [9, pp. 569-573] was printed in March 1918. As an epigraph, the article was preceded by words from N.A. Nekrasov's poem "Who Lives Well in Russia": "You are both poor, you are both abundant, you are both mighty, you are both powerless — Mother Russia!". The article is written at the moment of the great turn from war to peace; from the war between predators, sending millions of exploited workers to the slaughter in order to establish a new order of dividing the looted booty, — to the war of the oppressed against the oppressors, for liberation from the yoke of capital and for a future society of sufficiency and durable peace.

Russia had to experience especially acutely the sharpest turns of history, turning from imperialism to the communist revolution. In a few days, one of the oldest, most powerful, barbaric and brutal monarchies was destroyed; in a few months, a number of stages of conciliation with the bourgeoisie, of outliving petty-bourgeois illusions were passed, for which other countries spent decades; in a few weeks the bourgeoisie was overthrown and its open resistance in the civil conflict was overcome. Bolshevism made a triumphant procession from end to end of the vast country, and the lowest of the layers of the working masses oppressed by tsarism and the bourgeoisie were raised, introduced to independent life and endowed with freedom. The Soviet

republic was established — a new type of state, immeasurably higher and more democratic than the best of the bourgeois-parliamentary republics. The dictatorship of the proletariat, supported by the poorest peasantry, was established, and the implementation of the conceived system of socialist transformations began. Faith in one's own strength was awakened and the fire of enthusiasm was lit in millions and millions of workers of all countries [pride for everything done shines through in every Lenin's word.]

"And in a few days the imperialist predator who attacked the unarmed ... threw us to the ground. The predator presses and chokes and tears Russia to pieces with the greater frenzy, the more menacingly the specter of the workers' revolution rises in his own country [we are talking about Germany]. We were forced to sign the "Tilsit" peace" [9, p. 570].

But one must have the courage to look straight into the face of the bitter truth and "measure entirely, to the bottom, the whole abyss of defeat, dismemberment, enslavement and humiliation into which we have now been pushed. The clearer we understand this, the more solid, tempered, steel our will to liberation will become... our unbending determination to achieve at all costs that Russia ceases to be poor and powerless, so that it becomes in the full sense of the word mighty and abundant." And this will certainly happen, for there is still enough space and natural wealth, "there is material both in natural wealth, and in the reserve of human strength, and in the excellent scope that the great revolution gave to folk creativity, — to create a truly mighty and abundant Russia."

And Russia will become so if it throws away all despondency and all phraseology and, gritting its teeth, gathers all its strength. All that is needed now is to move forward along the path of the socialist revolution, not losing heart from defeats, to work on strengthening self-discipline, organization and order, on improving the system of universal accounting and control over production and distribution of products: "this is the path to creating military power and socialist power" [9, p. 571].

In the event of a heavy defeat (the consequence of which was the signing of the Treaty of Tilsit), Lenin says, it is unworthy either to swagger or to fall into despair, as well as to agree with accusations of betraying one's ideals and one's friends. The commander who leads the remnants of the defeated army into the depths of the country does not commit treason in relation to those units which he is unable to help, but fulfills his duty, saving what can still be saved, "ceding space to gain time", using any respite to gather strength. The war shook Russia, and it, undoubtedly, is moving "from the Treaty of Tilsit to a national upsurge, to a great patriotic war... to an international socialist revolution", and not to a bourgeois state. "We have been defenders since October 25, 1917. We are for the "defense of the fatherland", but that patriotic war to which we are going is a war for the socialist fatherland, for socialism as a fatherland, for the Soviet Republic..."

Instead of the slogan, Lenin continues, of bourgeois patriotism "Hatred for the German, beat the German", the Bolsheviks will say: "Learn from the German! Remain faithful to the fraternal union with the German workers... **History moves in zigzags and roundabout ways**. ***It turned out so that it is the German who now embodies, along with bestial imperialism, the beginning of discipline, organization, harmonious cooperation on the basis of machine industry, the strictest accounting and control. And this is exactly what we lack. This is exactly what we need to learn. This is exactly what our great revolution lacks in order to come from a victorious beginning... to a victorious end. This is exactly what is required of the Russian Soviet Socialist Republic in order to cease to be poor and powerless, in order to irrevocably become mighty and abundant***" [9, pp. 572-573].

[The very unexpected turn "about the German", very consonant with some progressive opinions in our days too! Taking this circumstance into account, a new relation of components with a perspective of increasing the contentful component (due to the growth of the economy) and an increase in contentfulness of the entire relation as a whole is emerging on the horizon].

5. "**Theses of the Central Committee of the RCP(b) in connection with the situation on the Eastern Front**" [10, pp. 145-147] of April 11, 1919 played a huge role in the mobilization of the proletarian masses in the struggle against Kolchak.

Kolchak's victories on the Eastern Front force both party organizations and trade unions to implement the following measures in the shortest possible time to involve broader layers of the working class in the active participation in the defense of the country.

- Comprehensive support for the announced mobilization. The mobilized must see the active participation of trade unions and feel the support of their working class. From each party and trade union organization, the Central Committee demands a weekly, albeit the shortest, report on what has been done to help the mobilization and the mobilized.
- In the frontline areas, it is necessary to carry out the universal arming of all members of trade unions. "Trade unions must everywhere with their own forces and means carry out a verification registration of their members for sending all those not absolutely necessary at home, to fight for the Volga and the Urals" [10, p. 146].
- The most serious attention should be paid to strengthening agitation among the mobilized, mobilized and Red Army men: not to limit oneself to lectures and rallies, but to ensure that every member of the trade union personally participates in agitation events and in personal conversations.
- "Replace all male employees with women. Conduct a new re-registration for this, both party and trade union. Introduce special cards for all members of trade unions and all employees with a note on personal participation in the matter of helping the Red Army" [10, p. 146].

- Immediately establish assistance bureaus or support committees with published addresses and notification of them to the population in the widest possible way. Every mobilized person must know that in such a bureau or committee he will find help, advice, support to facilitate communication with military institutions, etc. A special task of such bureaus will be to assist in the matter of supplying the Red Army with weapons, clothing, factory stocks of various property. "For this task, one must take it with all one's might", immediate assistance must be provided to military institutions by the population itself [10, p. 147].
- Through trade unions, the wide involvement of peasant youth from non-agricultural provinces in the ranks of the Red Army should be organized.
- "In relation to the Mensheviks and Socialist-Revolutionaries, the party line in the current situation is as follows: to prison those who help Kolchak consciously or unconsciously. We will not tolerate in our republic working people who do not help us in deed in the struggle against Kolchak" [10, p. 147].

In conclusion, Lenin calls to take up this work in a revolutionary, non-template way. Kolchak can be defeated quickly and finally, for the victories of the Bolsheviks in the south and the improving international situation contribute to this. "It is necessary to strain all forces, to unfold revolutionary energy, and Kolchak will be quickly defeated. The Volga, the Urals, Siberia can and must be defended and won back" [10, p. 147].

[And again, we see how, on the basis of an accurate analysis of the alignment of forces and the situation that has arisen (without any panic and cries like "everything is lost" and "every man for himself"), clear instructions are born and a complex of the most urgent measures is formed, aimed at correcting the situation for the better. We see from the *Content* of the given points how seriously Lenin assesses this threat, how he seeks ways and approaches to activating the creative energy of people capable of eliminating the threat. We also see how much weight the trade union movement had at that time: the trade union acts on an equal footing with party and management organizations.]

6. The article "**An Example of the Petrograd Workers**" [10, pp. 213-215] appeared in October 1919 in parallel with the resolution of the plenum of the Central Committee of the RCP(b) to carry out the mobilization of communists and send the best representatives of the party and the working class to the Southern Front in connection with the difficult situation that had developed there.

The workers of Petrograd, at the call of the party, began an intensified mobilization and sending of the best workers to fight against Denikin, who was actively helped with money and weapons by French and English capital. At the same time, foreign propaganda was working to intimidate the population and the personnel of the revolutionary troops.

Never before has the enemy been so close to Moscow, Lenin writes. "But to repel this danger, in addition to the former forces of the troops, we are moving new detachments of advanced workers capable of creating a turning point in the mood in the retreating units" [10, p. 214].

The disorganization of the army ranks was largely caused by a large number of deserters. In this regard, the support of the army by a new influx of proletarian forces is of paramount importance. "Unstable elements will be strengthened, the mood will be raised, a turning point will be achieved. The proletariat, as has constantly happened in our revolution, will support and direct the wavering strata of the working population" [10, p. 214].

For a long time, the Petrograd proletariat has borne more burdens than the workers of other industrial centers; on its shoulders are the struggle against hunger, and against military danger, and the pulling out of the best workers to Soviet positions throughout Russia. But there is not the slightest despondency or decline of strength among the Petrograd workers — they perfectly fulfill the task of the vanguard detachment, sending help and support where it is most needed. "When such fresh forces go to strengthen the faltering parts of our army, then the working masses, soldiers from the peasants, receive new leaders from among their own people, from among the more developed, more conscious, more spiritually firm workers" [10, p. 214]. This is the source of the superiority of the peasant army over the enemy, which replenishes and supports its ranks only with "landlords' sons". It is known that such "support" ruined Kolchak, it will ruin Denikin too. Lenin calls on other workers, following the example of the Petrograd workers, to intensify their activities in the troops, to show more initiative and boldness in the desire not to yield to the Petrogradites — and then victory will be for the workers, the bourgeois counter-revolution will be finished off. After Petrograd, Moscow has already started moving, after Moscow the rest must start moving.

[From the content of the article it is clearly visible how important the moral state (state of spirit) of the fighting soldiers of the Red Army is for Lenin. It is visible how truly significant the high consciousness of the advanced workers and members of the Bolshevik party was in those days! Again, it is visible how strong and unshakable Lenin's faith in victory and a favorable outcome of the armed struggle is, — his inexhaustible optimism in the most difficult moments of a mortal struggle causes deep respect.]

7. The article "**From the Destruction of the Centuries-old Order to the Creation of a New One**" [10, pp. 282-284], written in April 1920, is devoted to the issues set out in the one-day newspaper "Communist Subbotnik" of April 11, 1920. The main topic of the newspaper is the question of communist labor. This most important issue of the construction of socialism could be raised only after the proletariat had conquered political power, only after the expropriation of landlords and capitalists, only after the decisive victories of the proletariat that had conquered state power over the exploiters who had organized desperate resistance, counter-revolutionary uprisings and civil war. It seemed that such a

time had already come in early 1918, but a new, stronger wave of counter-revolutionary uprisings broke out so quickly that the Soviet power then had no opportunity to deal with the issues of peaceful construction. Now, after overcoming incredible difficulties and "unheard-of victories of the Red Army over the hordes of international capitalist reaction" there are chances that peace will be more lasting and stable.

Some experience in the construction of socialism already exists, therefore the question of communist labor can and must be raised point-blank. However, it would be more correct to say: not about communist, but about socialist labor, for we are talking not about the highest, but about the lowest stage of the development of the new social order growing out of capitalism. Communist labor is unpaid, voluntary labor, outside the norm, out of the habit of working for the common good and out of a conscious (turned into a habit) attitude to the necessity of labor as a need of a healthy organism. However, "it is clear to everyone that it is still very, very far to the wide, truly mass application of such labor for us, i.e. for our society, our social order" [10, p. 283].
But the fact that this question has already been raised by the advanced proletariat and the state power is a step forward. To come to the big, one must start with the small. "Subbotniks, labor armies, labor conscription — this is the practical implementation in various forms of socialist and communist labor" [10, p. 283].

Mistakes and errors in such a difficult matter are inevitable. "To build a new labor discipline, to build new forms of social connection between people, to build new forms and techniques of attracting people to labor, this is the work of many years and decades. This is the most grateful and noble work" [10, p. 283].

Now, after the overthrow of the bourgeoisie and the suppression of its resistance, there is already soil on which such work has become possible; the proletariat will take up this work with all its energy and will fulfill it.
[Again, the inexhaustible optimism of V.I. Lenin is admirable. The thesis about labor out of habit as a need of a healthy organism is closely connected with the thesis about the contentful filling of the forms of the labor process to the level of the identification of these forms in the final analysis with the very **process of cognition** itself and with the striving through such forms of the cognitive process to look around the corner, beyond the horizon, into the future as effectively and productively as possible.]

Conclusion

It should be said that the above-mentioned articles of Lenin were not selected specially or with any particular bias — any of his works of the indicated periods is built according to the stencil we have disassembled, according to the type of thinking that was formed in V.I. Ulyanov from a young age.

As can be seen, every article or work of Lenin, regardless of the range of issues considered in it, is a model of the effective application of the dialectical approach,

extremely in demand and necessary when conducting research of objects, processes, phenomena in any area of reality, in all spheres of human activity in order to obtain the most correct and contentful results of such research.

In each work, the scheme of productive ("triadic" or three-stage) development of the idea (thesis — antithesis — synthesis) is easily guessed, as well as adherence (in the analysis) to the well-known cliché of observing the unity of the historical and the logical.

What first of all attracts attention in the course of getting acquainted with the content of the theoretical works of V.I. Lenin? The same or similar algorithm for presenting material concerning the issues under study, which is due to the very universal nature of development or the very dialectical nature of any object, process, phenomenon under study. And Lenin inexorably follows this algorithm, revealing the dialectical essence of the problems under study ("piling up" events, emerging situations, achieved results, etc.).

Let us reproduce this algorithm once again.

1. Composing correct relations of directly interacting side-components in the forms (objects, processes, phenomena) under study.
At this initial stage of research, one must be able to identify and show the directly interacting (i.e. the most essential at the moment) opposing, competing, opposing sides-components in the forms-relations under study.

2. Determination and prioritization in the found relations, i.e. identification of the active and passive sides-components in the composed relations.
At this stage of research among the directly interacting components in their relations (as a rule, in pairs of such components) one must again be able to identify, guess, understand and highlight, on the one hand, the most *contentful* (active, leading) and, on the other hand, more *formal* (passive, conservative) components. Thus, such relations are brought to the generalized universal form {content/form}.

3. Determination of the probable direction of change (transformation), movement, development of the constituent sides-components (i.e. probable change in the correlation or balance of components) within and inside the relations formed from them, and consequently, the direction of variability of the relations themselves as a whole (taking into account the influences and impact of surrounding forms on these relations).
A correctly composed relation of two correctly identified directly interacting components allows to determine and designate the bias or direction of their subsequent change, movement, development of their relation; this bias or direction of movement-development of the relation is conditioned by the correlation (approximate) of components within the relation, i.e. the degree of predominance of one (*contentful*) component over the other (*formal*) component.

4. Forecasting (anticipation) of the development of the relations under study, i.e. determination of the prospects for the modification of the forms under study (objects, processes, phenomena), as well as the prospects for the emergence of new forms.
At this stage, both operational and strategic forecasts of the development of the forms-relations under study are made, which corresponds to forecasting the variability of existing forms and anticipating the emergence of new forms of reality.

When moving to the next stage of research or the next form of reality under study, paragraphs 1-4 are repeated in the same volume.

As can be seen from the presented scheme (algorithm) of conducting research, the identification of two (or more) directly interacting, opposing components in their relation turns out to be an extremely important point, since it is this *Content-form* structure (system) that will indicate the direction of its change and obtaining in the future an even more contentful structure or a new relation (system) composed of even more contentful components. It is important that these are not "pulled by the ears" components, not mechanically (or eclectically) combined opposites, but naturally growing one from the other opposing constituent sides, interconnected so much that one can firmly talk about their insignificance without each other.

A correctly composed relation of two directly interacting components is something (a system) resembling the behavior of a liquid (or other similar continuous medium) in communicating vessels. Here, for example, are such relations (or systems) as: {time/space}, {motion/rest}, {active principle/passive principle}, {energy/mass}, {field/matter}, {north pole of a magnet/south pole of a magnet}, {subjective /objective}, etc., etc., — they are examples of correctly composed relations of directly interacting sides-components of reality.

The correct choice of a pair of interacting components and the formation of a correct relation from them is tantamount to an artfully formulated question; then the very correct formulation of the question contains at least half of the answer to this question, which is a prerequisite for the successful solution of the task at hand.

Well, and examples of incorrectly composed relations can be given much more — all unfairly conducted research and obtained false results sufficiently testify to the initially incorrect relations identified [inappropriately chosen and designated so-called false grounds lead any research to a dead end]. Therefore, it is extremely important to identify the most essential sides of the problems under study, which are in direct interaction and direct relation to each other.

At each stage of the development of reality, at each specific spatio-temporal segment of it, one must be able to correctly identify and identify (i.e. recognize) the directly interacting components that are in contradiction or conflict with each

other, conditioned (we are talking about contradiction or conflict) by the search for a new form for the developing contentful component.

From the listed steps of the above scheme (algorithm), a methodology (and even more — a whole methodology) for the effective research of any issue, any problem, both in everyday life and in the field of science (so to speak, a universal research template) is formed.

Of course, in that former form Lenin's works (and they were written on topical issues in connection with some specific events and circumstances) today to some extent lose their *formal* significance, but "pushing" the author into the background for this reason is as reckless and foolish as, for example, giggling at the fact that Alexander the Great fought all his life on horseback, and not in a tank or an airplane. After all, in terms of *contentful* filling and presentation of views, his works are, without any exaggeration, masterpieces (for those obsessed with the idea of knowing the essence of dialectics). One just needs to look more pedantically into the composition of any of his articles to see the beauty of the logical-dialectical schemes, constructions and forms. The future requires a person ***to be more and more*** **versed** in the issues of dialectics.

As can be seen, in our research and conclusions we do not particularly touch upon the temporal context, focusing mainly on Lenin's logic — all the pearls of the research approach shine without a deep attachment to the nuances of that great historical era. The historical background in each particular case gives the development process only peculiar shades and features, leaving its core (i.e. tendencies and patterns) typical and universal. In this perspective, any article by Lenin, any of his works is a reader on dialectics, a manual on mastering the art of dialectical thinking (to some extent invariant with respect to specific historical frameworks), i.e. on mastering what belongs to the future. No one has been able to understand and feel the "soul" of dialectics so deeply for a long time, to the greatest regret.

And how much optimism and faith (namely due to the dialectical nature of the character) in a favorable, positive outcome of the matter is laid in each of his articles! After all, at times the entire revolutionary movement hung on such a thin hair that it was time to fall into despair and run anywhere, fearing the reaction. He did not flinch once, and there are no traces of retreat or repentance found to this day by either "impartial" historians or rabid enemies. Only forward — to the victorious heights of scientific thinking.

It would seem that Russia has a full set of conditions and resources (both human and natural) to be the most self-sufficient and harmoniously developing state on the planet. And the understanding of the direction, trend, perspective of the movement-development of the people and the country (where and why are we going?) has been lost since the times of the last most integral dialectician, which was V.I. Lenin. The idea (in the most general form — ideology, and not just ideology, but the most advanced ideology, which Lenin was guided by) as the most perfect derivative of human consciousness and is the guiding star, which is

the most *content-capacious* of all reliably known to us forms of our (human) level of development of reality, — why the most *contentful* flows of the level of human consciousness strive to possess this form (*to clothe themselves in this form*). So what, it would seem, is simpler — take and learn dialectics from Lenin (master, so to speak, the dialectical style of thinking and advanced ideas, which are an inevitable product of this kind of thinking) instead of subjecting him to ostracism. But no: to grow up to the perception of his ideas, it turns out, is much more difficult than to revile, showing off one's not so perfect brains and very limited abilities.

Marxism is supposedly too orthodox, and Lenin's ideas have led to a dead end and have lost all relevance — these are the arguments of today's academic community (primarily among economists, politicians, historians, political scientists, etc.). Enlightened people, however, say that one should learn to follow not the letter of Marxism, not the letter of Lenin's manuscripts, but their spirit. The spirit (*contentful* principle) of dialectics is eternal: it only passes from *form* to *form*, i.e. it simply changes the *form* of its acquiring. And to learn to grasp, to perceive this spirit — this is the purpose and main goal of the life and activity of every **educated** person.

The approach described here is intended to direct a person not just to the knowledge of some world that has existed since time immemorial, but predisposes to a meaningful study of everything that "is being done", that "is being reproduced" and "is being recreated" right here and now — in real-time mode both in our near and far environment.

Another appeal to Lenin's words that even 70 Marxs will not be able to cover the "sum of all these changes in all their branches" and cope with solving such a task, contributes to the realization of the circumstance that any, albeit the most adequate at the moment, solution models the behavior of a very limited, "trimmed", "frozen" system, while reality is constantly changing and slips out from under any rigid and comprehensive control. That is why one must learn to perceive and grasp not the volumes of all kinds of changes of real *forms*, but the trend of these changes, which is ultimately the key and condition for the successful cognition of developing reality and the comprehension of objective truth.

With an eye to what has been said, it becomes obvious how one should relate to the question of the cognizability of the world. Since the world, the Universe are incessantly and unceasingly "being made", "being recreated by piling up" (according to the formulation of the principle of *self-development*), and do not represent a kind of suitcase with books, then the cognition of the being made, every moment reproduced world — this is all the more an infinite and infinitely fascinating *contentful* process. How can one talk about some kind of comprehensive, complete and final knowledge of the world if the world is incessantly "unfolding" with more and more *contentful* forms? In this section, it is more reasonable to talk about the cognizability and cognition of the world as about the improvement of capabilities for

anticipating such an "unfolding" of forms, capabilities for guessing the emergence of new ones and the trend of changing existing forms, i.e. for forecasting future events and their consequences, speaking in the usual everyday language. Effective forecasting of the development of the forms of reality — this is the perspective of the *contentful* development of mankind. In times when, due to the infinitely routine everyday cyclicity, a person sees no meaning in life and in his existence, an opportunity opens up to look at all this with completely different eyes. Every person is not just capable, but is obliged to become a researcher. In each of us, a subconscious striving is dormant to manage to look around the corner, beyond the horizon (satisfying one's innate curiosity), to anticipate the onset of events, to forecast and anticipate the emergence and development of new forms. It is only necessary to activate this dormant natural striving and give it a new impulse, i.e. consciously bring it to a new level.

There is not a single argument refuting or at least questioning the validity (universality and generality) of the dialectical concept of the development of reality — undoubtedly, it must be mastered and learn to correctly and effectively apply it.

In conclusion, I would like to appeal to the youth again: read Lenin, guys, enjoy the beauty of thought, clarity and consistency of the presentation of the material, as well as the magnificent Russian language. This is our largest national thinker, a born dialectician, who will give odds to any modern philosophizing professional. His works contain developments that will be of interest to society and the state for decades to come. This is not the priests' scholastic tricks, sucked out of the finger and postulating the Absolute *Form* — with whatever spirituality, "spirituality", perfect organization and Absolute *Content* (**in words**) this ***Form*** is identified with. Through the mouth of Vladimir Ilyich, life itself speaks to us. In his reflections you will find answers for yourself or at least prerequisites for finding answers to the main worldview questions, you will feel out the right path to understanding the patterns of the development of reality (both of nature and of human communities).

One should not think that everything has already been passed, laid out and summed up. Everything is just beginning — with each new turn of the development of reality, the struggle for the highest *contentfulness* acquires new and more diverse forms: "And again the battle continues, and the heart is anxious in the chest, and Lenin is so young, and a NEW October is ahead...".
